Things aren't so stable over there, huh? <g>. It's important that a
browser sit on top of a robust OS.

Unfair, maybe. My point was that a corrupted GIF caused "the latest and
greatest OS" to crash and burn. With Microsoft and Netscape's resources,
that's inexcusable. I wasn't actually online when Netscape crashed, so
many of the Internet's complexities didn't come into play, which holds
true even more so with CAB. Normally it's a difficult browser to crash
offline (no overlay to contend with).

I've seen some of the NeoPlanet skins, although I know there's more to
it than that. Evidently OE5 for Mac is considerably different than the
Windows version (which I've never used). To me it's a very good mailer,

but not so much as a newsreader.

Right. I was never happy with some aspects of Mac OS 8.x until those
add-ons were purchased. I also had to install the freeware Prestissimo,
to give Mac OS the window scroll buttons we're used to under GEM.

Obviously there are no Atari applications that you can't live without.
For me it's Calamus. To replace it on the Mac would require Quark or
InDesign (not cheap). I also have a few years invested in the steep
learning curve of Cranach, which unlike Calamus wasn't stable under
MagiCMac. It's not easy learning to walk again. It depends on how much
software reliance you had before.

I think the Internet has caused more people to "jump ship" than anything
else, siphoning off the user base even faster than would have occured
without it.

Serendipity perhaps?

My "move" was based more on the fact that I wanted a faster machine. Had
the Milan been available here I would have bought one. No regrets,
though, especially since the browsing experience is so much more
enjoyable now. But CAB on a fast machine with a problem-free overlay

would have been enough to keep me happy.

Yes, I've tried iCab. My browser of choice, though, is Explorer 4.5,
mostly because of its speed, features, and good support of Cascading
Style Sheets (which I'm in the process of learning). iCab has some very
good merits, especially its predilection for compliancy.

3571. Gemulator98 and Megamax Laser C compiler problem

Newsgroup: comp.sys.atari.st
Date: 1999-12-07 00:00:00 UTC
From: Joseph Zorzin <redoak@forestmeister.com>
Message-ID: <384D707D.1264E7A2@forestmeister.com>
Source record: 69212

I downloaded Gemulator 98 and 2 versions of TOS, 1.04 and 2.06.
I manage to get Gemulator to see both and then I've been able to

run many of my old Atari programs but I'm have trouble with the
Laser C development program.

Laser C loads- but- if I have Gemulator use 14 megs of RAM,
Laser C will crash trying to open any code file or when
attempting to make changes to it's config.sys file.

So, I adjusted Gemulator to only use 4 megs of ram on my
Pentium, and now the above problem doesn't occur, but when I
tried to compile a code file- it crashed and burned my PC
operating system (Win95 OSR2)- I ended up with a black screen. I

had to reboot, run scandisk, and it fixed a damaged file.

I don't get it. The author of Gemulator says it should work. I
got a few messages from him, but few suggestions, and he seems
to have given up on this problem.

The reason I still care to develop software with GEM and TOS is
that I wrote some software that I've come to depend on in my
conulting work. I now also have MS Visual C++, but that's a
steep learing curve before I'm ready to try porting over GEM
programs to Windows- I'll do it eventually, but in the short
term I'd like to continue with TOS and GEM.

Anyone have any suggestions?

When I chose to have Gemulator simulate Atari disks, i.e. the virtual drive that came with Gemulator98 (free download)- I couldn't manage to put anything into it. I opened up a window to my PC's floppy, then a window to the virtual drive C- then tried to copy files from the floppy to the virtual drive and got a message saying that drive C was damaged! I'm obviously doing something drastically wrong.

Yup. Mine's always had an English keyboard layout. If you download the
MagiC programming docs there are utilities included for creating a range
of layouts, but I hasten to add I haven't tried this at all.

> 2) Is Magic 5.xx still available at all (in English or Swedish)?

I don't think so apart from that included with the English MagiC-PC 1.2.

> 3) Does iConnect support serial connections (e.g. null-modem)?

Nope. But you could use STinG anyway.

> NOTE: Magic 6.xx cannot be burned into an eprom, apprarently.

Can't confirm or deny, but maybe it's too big? I'm guessing wildly here
though and don't really know what I'm talking about.

Absolutely.

>I think the Internet has caused more people to "jump ship" than anything >else, siphoning off the user base even faster than would have occured >without it.

Agreed. I think most people can live with their old graphics programs, word processors, DTP programs, etc. But the internet is very unforgiving of old, obsolete software. And it also is real good about showing deficiencies in the speed of the processor.

>My "move" was based more on the fact that I wanted a faster machine. Had >the Milan been available here I would have bought one. I've bought a ton of hardware and software from them over the years and couldn't be much happier with their service. I also like that you can order stuff through email, if you like. Once they have your credit card number on file, you only have to tell them what you want and to use your card on file. If they're only open on Saturday now, that's all the more reason to use email.

As far as I can tell, both of you are correct. Terry, I hope you stick
around CSAST for you provide a point of discussion that I find useful.
On the other hand, you do seem to mention your computer rather often.
To get to the point, I wanted to let you know that I think your posts
are fine but that you really aren't being attacked without reason. A
bit more civility on all sides is called for.

For Sale: Atari Object Mover Software for Kurzweil 1000 series synths.

I have a copy of this software including binder, operating instructions etc.

If you have a Kurzweil 1000 series and an Atari ST then you probably need this. Allows you to handle the 1000 series synths from your computer. Works with Keyboards and modules.

Trades or Offers.

Na, ich denke, ich kann auch auf "althochdeutsch" antworten...

Direktes Lesen von SDO durch Dosen-Programme ist
AFAIK nicht moeglich. Am besten, Du findest jemanden, der noch
einen Atari, PC oder MAC unter MAGIC, plus Signum 2,3 oder 4 hat
und damit die Dateien einlesen und als ASCII speichern kann.
Leider sind auch die neueren Signumversionen (ich habe 4-irgendwas)
nicht gerade "exportfreudig"...

I think you can't say that since v1.63 won't be bundled with the Milan.
The successor of Draconis 1.7 will be bundled with the Milan, according
to Axro. Because this "high-end browser" and Draconis 1.7 aren't
available yet it would be wiser to judge when both are available.

Greetings,
Matt.

3600. It's time to vote for the MGC!

Newsgroup: comp.sys.atari.st
Date: 1999-12-07 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <B4719C37.870%collins@bulli.com>
Source record: 69260

You can now download the game entries and the vote form for the MagiC game contest, organized by the place2be/MagiC Online.

All together there are 8 games in the compo. This is down from 11 (1 was disqualified for premature release, one was a no show, and one was forced to cancel at the last minute.)

Please download and spread this archive. The more votes we get the better. Please try to spread all 8 games together, and the vote form along with voting instructions is included in the mgc archive.

The games are all GEM and should work on most atari configurations.

Well, may the best game win!

Direct Download: http://www.place2be.de/mgc/mgc99.zip
MGC Homepage English: http://www.place2be.de/mgc/contest.htm
MGC Homepage German: http://www.place2be.de/mgc/contestd.htm

PS: This is the first of many programming/etc contests. We learned a lot from this one so expect the next one to be even better!

IMPORTANT NOTE: The Vote forms must be sent to collins@bulli.com no later then midnight of December 25th 1999.

TOS includes BIOS and a default desktop, so it's the same.

Using Magic 5.xx, you can even burn the OS with CBHD onto an
EPROM, so you have something to boot your hard-disk with.

I was thinking of trying that on the stacy, but there are three
questions:

1) Does Magic support keymaps other than german QWERTZ at all?

2) Is Magic 5.xx still available at all (in English or Swedish)?

3) Does iConnect support serial connections (e.g. null-modem)?

NOTE: Magic 6.xx cannot be burned into an eprom, apprarently.
Can anybody confirm and explain why?

Since the Milan already comes with an enhanced TOS 4.04, this
should be enough. Let ASH and Woller fight the good fight and
figure out their own distribution channels afterwards. Better,
let them learn the meaning of the words "international market."

>are inserted later and were not present when booting.

Uwe,

It is hard to disagree with the author of such very useful software
when he is laying down the law, but let me tell you what I experience.

I have a TT with various items including a Syquest ezFlyer on the SCSI
bus. The ezFlyer cartridges have one partition with a sector size of
4096.

On the DMA/ASCI bus I have a SupraDrive, again one partition, sector
size 512.

I have HD Driver 7.71 with the removable media setting at 1 partition,
4096 sector size.

There is no problem with the ezFlyer, but if I boot Magic 6 with no
disk in the SupraDrive, any later attempt to access the SupraDrive
causes Magic to report the drive an invalid.

This does not happen with TOS or Mint.

Nor does it happen with HD Driver 7.00

The Supradrive is now fairly ancient - I bought it in 1989 - but it
works perfectly.

Joergen Bak wrote:
>
> That`s right Dennis, it made my day interesting to. I can`t wait to see
> MagiC with networks. I hope it meens that I can network my Falcon with the
> Mac trough the LAN port?

Um...I wouldn't hold too many hopes with this one. I've tried that already with STiNG on my Falcon, and a Mac client that allows IP masquerading. I had a LOT of trouble getting the Falcon/Mac to talk TCP/IP to each other, and even then I cannot get the $&^*#$ LAN port on the Falcon to RECEIVE data faster than the speed of a 56k modem. SENDING from the Falcon is better when I can set the serial/LAN to 230400 baud and get 15-16000cps. Other than that 57600 baud is all I can use without errors ruining the whole show. To get the Mac to cooperate with slow baudrates REALLY took some effort... :(

Does anyone know of a software/hardware fix that can allow me to use 230400 baud on the serial/LAN to receive data via null modem or TCP/IP?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Try 1STGUIDE...

It works with or without JPEGD on the Falcon, so I assume it will happily run on a Milan or Hades...the faster CPU on those machines -should- make the depacking process a lot quicker than it is on my Falcon without JPEGD...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi all:

For those who need a Fax program/BBS. I just found on line this very good FAX program which is as good (or better) as what I have used on other computers (win etc.) It is called StarCall by Ingo Linkweiter. The Fax program even has a cover editor with tools to draw. The program does as well Voice.

The file is called STARF30AE.LZH

The Catalogue now has over 500 separate Atari Items.

1) New section of unboxed Lynx Games
2) New section starting for TT compatible game (feedback appreciated)
3) CD section mostly finished

Next will be working on the Utilities Section.

I plan for a pdf version of the catalogue or even a downloadable html...
comments?

So visit the site and somepoint and let me have your comments, feedback
appreciated. info@1632systems.co.uk

http://www.1632systems.co.uk for the home pages, which are still being
worked on.

http://catalog.zen.co.uk/actinic/1632Systems/ for the sales catalogue

In October of 1998 I ordered a Link-II and zip power cable from Thomas Harker of icd (www.icd.com) who (formerly, at least) had a great reputation in the atari community (I own 2 ICD drives already for my 4160STE!). Anyhow, over a year later, and dozens of phone calls to Tom, the Link-II is still not here. He is very polite on the phone and is always "just about to send it out to me", but never does.

Has anyone else experienced this?

What happened to ICD, and why does their website seem to indicate a company that is fully in business?

I am not wanting to slander ICD or Tom with this post, I really just want to end this transaction and receive my hardware that I paid for. Maybe some others who read this newsgroup and wish to place an order with ICD or have a previous relationship with Tom, could send him email asking "so, why haven't you sent Dan Vernon in Seattle his Link-II?"

thanks for listening,
Dan

P.S. here's my original email to tom over a year ago:

At 12:05 PM 10/13/98 -0700, you wrote:
>Thanks for the info Tom. I just dropped the money order in the mail today: $147.90 made out to ICD Inc.

Hallo,

i want to read my sdo-Docs (Signum) from my atari st
on windows (word ect.).
I tried Notepad and Word, but it failed.

The other problem is, that i can't start the signum-Program
again on my atarie st, cause the atari is demaged.
I have the external harddisk (scsi) and want to mount this on linux.
But it failed too.

Can anybody help me ?

thanks

3623. Re: .ST File to ST readable Disks

Newsgroup: comp.sys.atari.st
Date: 1999-12-07 00:00:00 UTC
From: Chris McKay <the_mc@vision.net.au>
Message-ID: <384cefd0@tethys.vision.net.au>
Source record: 69283
Cross-posted to: comp.emulators.misc,comp.sys.atari.st,comp.sys.atari.st.tech

Being new to the ST hardware myself, I ran into this problem as well, just a few days ago.

What you MUST do is use low-density disks, or tape over the other hole on your high density ones. Thats the only way Ive been able to get any results (although the ST will quite happily format a high density disk to 720 kb).

Ok, once youve got some suitable disks, use a program called HD-COPY to format the disks to whatever size you require (usually 720kb to 820kb is common from what ive seen). Take a look at the .ST file you wish to make an image of. Its size is slightly more than the required size of the formatted disk, so you need to format the disk appropriately. I know MAKEDISK has the ability for format disks as it needs them, but ive never been able to get it to work (it keeps going on about bad track 0 or some shit), so I always use HD-COPY to format the disk first up and then run MAKEDISK. Once the disk is formatted, run MAKEDISK to write the image (MAKEDISK /write diskimage.st /auto).

Wait a few minutes for it to create the image, slap the disk into the ST, turn 'er on and yer away!

It took me a while to realise the ST doesnt like high density disks that have been formatted on a PC to a lower format (for whatever reason). You MUST either use a low density disk or make sure the other hole is taped over.

Hope that helps (well, it worked for me!)

MC.

Hi All,
Is their an updated version (if so, where can I find it) to:
24 Bit JPEG viewer v4.21 for Apex Animator
For use with Falon 030 machines
c. 1995
I like the speed of loading and smoothness of the pic so I use it
as an External Viewer in CAB and as an Installed Desktop Application.
The package came with APEXJPG.GTP, FLC, GIF, and TGA.
John

Hi Jos, I been there to. Can`t get Wensuite to connect at all. And I don`t think it is possible with the latest version (v. 3.20b). It is a shame, because it looks better and better, and very fast. The latest version even had the problems with special chars fixed, now it shows the danish characters right. From my little test, it still have some way to go before it is of any use,- it didn`t show frames in a proper way,- didn`t break the lines right (in frames) and it can not reload another page after 2 seconds.
Anyway it look nice, but is of no use at the moment. If anyone know how to connect Wensuite to the world, I like to hear it to.

cheers

Joergen

>to support).
>So it is a good thing.

Right you are, I would say in a good and bad way. Good because it gives
the user a choice, and bad because it gives the programmer more hard work
and it makes the programs bigger (I think). And we sometime ran into
compatibility problems, but we always had that. I remember when some
programs required a German TOS to run, or a specific TOS version.

>Also programing is most of the time created by a need. How many editors
>have to be coded until one really makes the difference. Then people start
>using it. and the need is not as strong. So less development in this
>area.

Rigth again, I was mostly thinking of the time when apperently every shool
kid in Germany had an ATARI and was turning out all kind of weird programs
every week. Like CNC-Simulations, like ADRIANE, a funny drawing prg., or
KRAFTWERK-Simulation, where you was abel to simulate a complete Powerplant
with boilers and generators. I know there was programs comming from
France, Nederland, the US and UK as well, but most of the programs here in
Denmark was from Germany. BTW, we had some Danish programs to, like
Harlekin, Twist and HighSpeed Pascal.

>Web browser is a need. but is a HUGE project. (need to know the in&out of
>sockets, multithreading, all picture format unpacking, keep up with
>javascript, html tags constently changing, correct GEM programing and

>
>Now that is quite discouraging.

I know that a browser, or any modern software, isn`t something you do overnight, that`s why I am willing to pay for it, if it works. I also know that you had your share of problems with MagiC, don`t know why, but I understand if you do not care about MagiC anymore. On my setup it works, so does CAB, FIFFI and E-mailer, even all 3 at the same time. I might be some kind of an ignorant, because I don`t even know how.

- snip -
>Atari world as I know it, is ending.

Well shure it is,- to use some of your own word, it moves on.

I have a 520 STFM sitting next to my Falcon, I don`t know why, because I hardly ever use it anymore, it has not been turned on for the last 6 month, it just standing there with the HD full of obsolete software. Software that once was ahead of its time, but don`t have support for color or what ever I got used to.

>
>(btw, iconnect is as slow/shaky as stik was, so I really don't get why
>you
>guys get so exited about it). When CAB resolved, it temporarily "lock"
>the
>other connection, also slowing it down. Of course it can't be a setting
>problem, coz it is dummy-proof, And there is no such option anyway. So it
>is a design problem, But I thought I heard you said it was the best. Geez
>what a reference. Thank god I know what the best I can get on my atari
>is.

If that is your experience, I can understand your dissatisfaction, but as I have said, this is not what I can see. Don`t know if any of the apps. "lock" anything, I only know that the modem blinks like hell when I run more than on application at a time. The only time I experience a slow down is when I start E-mailer to get news and mail, and play a little Solitaire while it download.

Whatever setup you have on your Atari, is proberly what you like the most, and that`s good. We are differend people with differend needs and preferences, thank`s God we have a choices.

cheers

Hi all Atarians!

I'm from Rio de Janeiro, Brazil, and recently I got a German Atari 1040
STFM.
Problem: Germany uses 220V/50Hz, and Rio de Janeiro uses 110V/60Hz.
Result: I think I blew up the power font :(

Can I use an external power font with my STFM? (A PC font would be
great!) If yes, how I can do it?

Hi Everybody

As an old fan of the Atari-computers, a few days ago i bought a second hand Atari 1040ST for 20 dollars. I had a atari once, but stupid enough i sold it a few years ago. But now i have one back, and i'm trying to download some old games we ad so much fun with. It seems I need a program called ST2DISK to convert .ST files to the old PRG files for Atari. I downloaded this program from the net. But for the program to work i need a 'key' from the maker of the program. I tried to contact him at the adress in the program, but to no avail. Has someone a 'key' for me so i can use this program. It is probably a .LIB file, (i guess)

My e-mail adres is herm@tref.nl

Many thanks in advance from an old atari fan

I guess it depends on your definition of inexpensive. But realistically, the answer is no. I resisted long enough and was ready to join the rest of the world and be able to use all the latest hardware and software goodies. (Yes, I sold my soul to the devil, Bill Gates. :)

>I can't help but feel that the Atari world these days really resides
>across the Atlantic.

It sure seems like most of the good software comes from over there. Probably because Atari was better ran over there during its hey day, so they gained a much more solid user base.

>True. But personally I could still live without JavaScript and fancy

Don't know about Swedish support in MagiC, sorry. The English one seems
to have the keyboard mapping built in: it doesn't have a KEYTABLS.SYS
file in the Xtension folder.

> > If you download the MagiC programming docs there are

Sorry, best I can do: FWIW there are precompiled binaries for French,
UK, US and SWG (Swiss German???) layouts. These generate a KEYTABLS.SYS
file which you put in the Xtension folder of a German MagiC. This is all
I can glean from the comments in the source files. As I don't know any C
the rest might as well be in Linear A as far as I'm concerned :-)

Might be worth checking out MagiC Online in case there are any
downloadable mappings available pre-done, I guess.

>On Mon, 6 Dec 1999, Joergen Bak wrote:

>Don't you feel like a little lagged?
>Within our own "community" there is a huge difference in technology.

Yes, a huge difference in hardware and software technology. And as long as there is still a spark of competition to serve a consumer/user need this to me is not regarded as a bad thing (No pun). The improvement for Magic users must be welcomed by them. I am one of them, but let me follow that up last. Magic with Iconnect currently has no networking. And surprisingly enough Public Domain technology prevailed, and currently does in this regard. With both Mint and STing. As well as the masquerading available to both. Of course a Magic user could use STing and Iconnect at the same time as they appear to coexist. (I have this on hearsay). I use STing.

However as a lowly humble ST user, my ST can only use Magic with Iconnect, or STing. Mint and Mintnet is out of the question. Geneva is too slow. As a lowmemory ST owner, sometimes even Magic w/o NVDI uses to much memory to Web Browse. But STing still allows for this single tasking low memory beast to do it all as well as interact in an intra-net. Even without an HD.

So when you speak of technology, I hope we realize that we all aren't TT/Hades/Falcon/Milan users here.

>> Even if I have to admit, it is not like 10 years ago, when there was a new
>> PD disk, with all kind of strange programs, almost every week.

Oh boy!! Ten year ago, around here in Canada the ST was dying fast. I still consider that TAF 1992 show a miracle.

>1)If you really look around, it very close to.

Nope.

>I know I can't keep up with all updates, and new programs.

Who could, keep up with all the updates, you are doing most of them:-).

>2)Development is different, in a good way I would say:
>At the time there was not much softwrae, so anything had to be done, with

>sockets, multithreading, all picture format unpacking, keep up with

>javascript, html tags constently changing, correct GEM programing and
>STILL having the constraints of that it NEEDS to run on a 520st).

Hey, I will decrease the ante. I will give you an XTRA 1/2 Meg or Ram to
make the program work. I have pretty much given up on the 520ST STOCK
internet possibility. (It still could be done but what would it do:-).
However, STing and any of the mailers, Antmail, My Mail should work.

But really what we need is an internet midimaze, really we do! Only natural
way for Atarians to fight their battles. (Make this work in 520K too).
I could just see it now. Pop in the floppy disk of the hdless 520ST.
Doubleclick, connect to the net and start killing the army of HADES!

>Bengy, Dennis and others:

>Atari world as I know it, is ending.

Is their Magic for the Hades?

>(btw, iconnect is as slow/shaky as stik was, so I really don't get why you
>guys get so exited about it).

I believe things have changed dramatically with regard to the speed of
iconnect. As STing has become the stable performer, Iconnect has benefited
from constant development and an increase in speed that may leave STing
users wanting. Unfortuneately/fortuneately you will have to want Magic too.

>When CAB resolved, it temporarily "lock" the
>other connection, also slowing it down. Of course it can't be a setting
>problem, coz it is dummy-proof, And there is no such option anyway. So it
>is a design problem, But I thought I heard you said it was the best. Geez
>what a reference. Thank god I know what the best I can get on my atari is.

Actually STing (well I use the old 1.08/12dialer) combo with Cab and Dans
latest ovl, and it does take over the system, especially troublesome if it
can't resolve the url. It is quite a wait and really the world is ending.

Well, I will be experimenting with your best in the coming new year.
I just don't look forward to tar, gzip combinations and still haven't
figured out how you guys format a drive in the minix format to get
longfilenames, and I am afraid to lose all my current data on the hd of my
TT.

My TT came with Geneva, I installed Magic 4. and Multi Tos (just to have it).

My Falcon has Geneva/Multi-Tos/ and an older version of the mint prg and no other programs for mint. Simply used to get Premptive Multi-tasking, but this doesn't seem to stop Cabs resolver function from taking over. Or the delay to regain control is still pretty great, before the resolve takes over again.

>EOF

All my STs have Magic. Call it what you will, I can't see any better multi tasking for an 8mhz machine. It blows away my old A500 I had.

And even as fast as Magic/NVDI is, I still like old TOS and the LGD.

Later Brian.

Since you live in the USA, this should be easy, but not worth it.

Since you yourself have some proof of purchase. The money order will have been cashed and your bank will tell you this, they have good records. Now you go to small claims court and seek judgement. Or even worse you can go for mail fraud. This is a serious offense in both Canada and the United STates. I sent a letter off to a business with a shady reputation. After a knock on the door from the Royal Canadian Mounted Police, He actually managed to ship the goods for real.

It has nothing to do, if he is a nice guy or if he used to support Atari or if he was good in the past. I have no idea how many of these links they have made and still have, maybe he doesn't have any. But I will say this, the longer you wait, and you have waited to long as it is, the less chance you have of receiving your goods.

I hope things work out for you because I want to get some of these link devices as well.

Oh, BOO-HOO, you poor little girlie man. Did you fall down and land in your
own little girlie man baby pooh! You are an idiot. You get your pirate
answers off your pirate sites. Not here. You are a complete fool. And to
come back here crying because, I didn't treat you right, and have all these
lame excuses. Patrick you are a DUMB ASS! What do you expect. The Pompey
Pirates said it right when they said, DON'T BUG US, DON'T BUG US, because
they would have to deal with whining little losers like yourself. "Oh, I
want to steal some software and get free games, help me, help me, oh, and I
am stuck too, help me help me". When suffice to say you only needed to ask
for help in playing the game, you had to announce to everyone here that
you have stolen pirate copy, that will work on your PC. But this to is
irrelavent because you are actually using a stolen PC copy on your PC.

Fools like you get places like LGD shut down. LGD looks pretty safe but
, IT IS YOU, the BIG DUMBASS IDIOT, that brazenly announces where
to go get this stuff. Not ME. And while their house looks good today many
of these websites offering commercial games have to move around alot.
And it is not public domain YOU FOOL. Who do you think has forced these
sites closed time and time again. My GOD ARE YOU DUMB! What is wrong with
you to be so stupid. To not ask a simple question about a game without
saying you stole it. To not use the website BBS designed for such
discussion.

You are so stupid, why do I waste my time.

>And the reason I asked on this group is because I've only ever seen Captive
>for the ST, and didn't even know there was a PC version... And none of my
>friends knew either... So I figured my odds of finding someone who would
>know the answer would be a lot better in the Atari community.

THis is why you have NO ATARI FRIENDS? You don't even deserve to have
a computer. Go get a playstation, you act like 7 year old baby.

>Try to be constructive next time.

Is this constructive enough for you CHAMP.

I got the program Atari Works with my Second Hand Falcon. I have just installed it and played with it enough for the last few days to realize that I really like it. I didn't at first, but it has grown on me. What I want to know is if anyone has used the Database extensively to realize its limitations. Any information is welcome. Same goes for the spread sheet. I currently use LDW Power.

>Can anybody help me to make this installation work ?

I hope so, but I need more info to go on:
- Your Falcon config (Memory amount, FPU yes/no)
- a description of the 'crash'. What did it say exactly just before
and right at that time.
- Is this the first time you are using that particular SCSI disk, or is
this a setup known to work. (To exclude termination and cable errors).

BTW: A better place to ask NetBSD/Atari related questions would be the mailing
list 'port-atari@netbsd.org'. You can send to it without subscription, but
you can also subscribe by sending a message to majordomo@netbsd.org with in
the body 'subscribe port-atari'.

Dan,

Sorry to disappoint you, but you are yet another victim of ICD. Back
in 1997 about 50 people pre-ordered the ICD/BCD Catbox interfaces for the
Atari Jaguar, I was among them and plunked down about $160 for a pair, plus
shipping. Well excuse after excuse, a website was set-up a list of all
the people who were scammed were put together, they were mailed to the
local BBB and USPS office in ICD's state. Noone has ever received a
single piece of hardware.

Word of mouth is Tom Harker is now running a local ISP and invested all
of his money into it and no longer is shipping items, seems he has no
problem taking the orders AND the money, but never ships anything.

It is a true tragedy too, because his company produced some of the best
products both hardware & software for all Atari products and now he's
turned into a mail fraud.

I really was asking for plug&play support here. If I have to
make my own RSC and keyboard maps, ASH might as well pay me to
do it, because I'm doing their job.

If I remember, Danish uses ae, slashed o and a ring. Those also
exist in the Atari systwem font, but at different locations than
ISO-8859-1.

What your friend needs is a mailer that handles this mapping
correctly. I beleive aMail supports this. Pine definitely does.
I'm not sure about NyMail.

Still, it's really horrible how most of the Atari platform's key
developpers and retailers all go down through the back door, but
act like they're still supporting the users.

Toad, Computer Direct, Aixit, TUS, Titan... all once admired and
perceived as honest Atari enthusiasts, all having disappeared
through the back door, while shagging mere users in the process.

sigh

There is still a point where you should _expect_ to upgrade to more powerfull offerings of the platform - like the TT/Falcon, at minimum. People _cannot_ have SSL-enabled browsers that access their bank account within 4 MB of ram, nor to run SSH on less than 68020, for instance.

I had this discussion a couple of days ago with Bernard Diotte of Microdell (a store in Trois-Rivieres QC that supports Atari) and, without hesitation, Berny conluded that the TT should now be our minimum support base.

IMHO, he is right. The ST has limitations and we must upgrade to something more potent as a minimal support level.

When retrieving messages for reading off-line, NEWSIE works perfectly.
But all my attempts to read news on-line always have had the same
result: hanging computer when closing a current window.
More problems appeared when wanted to use some different news servers.
In such a situation the only solution is NEWSwatch + Okami.

No, but I can speculate a bit.

If my information is correct, he went through a divorce that kind of wiped out ICD, lead to a bit of financial difficulty , and kind of took some of the wind out of his sales personally. The ex essentially froze ICD for a couple of years and as a result ICD kind of split up.

Just my op, but since everything associated with Atari is a combination of small and hand to mouth; death, divorce, personal difficulties of *ANY* kind are going to have an impact on us more then other systems. I mean Bruce and Kathy at B&C go to their sons graduation or Brad Koda at Best gets a hang nail and we are cut off from our suppliers.

I don't like it, but I prefer it to the alternative and understand it.

I would guess it has a lot to do with pride.

I ordered a link II from icd in august and i got mine in about a week. But
they are located about 40 miles from where i lived at the time, so maybe
that had soemthing to do with it.

On Wed, 8 Dec 1999, Brian Van TIlborg wrote:

> However as a lowly humble ST user, my ST can only use Magic with Iconnect,
> or STing. Mint and Mintnet is out of the question. Geneva is too slow.
I would agree with that.
But then, aren't you disapointed with your magic/st?
That is the whole question.
the ST was nice. and still is nice for some use (MIDI, simple accounting,
coding demo, hardware test development (sensors etc). I understand that.
But when I read, can I play mp3 on my 8mhz st with 500k of ram. I don't
know what to think really. Yes people are disapointed and just blame it on
"ATARI Computers" when indeed. Atari can do it.
Just not the ST.

That is a big difference to me.
And watching some people busting their butts (Milan, Medusa etc) trying to
keep up with technology. People still use their ST, yet still complaining
about the lack of power.
Now I understand that 3000 USD for an Hades60 is a tad pricy. And defeats
the whole purpose of Atari spirit (power without the price).
But Milan conserves this ideology pretty well.

> As a lowmemory ST owner, sometimes even Magic w/o NVDI uses to much memory
> to Web Browse. But STing still allows for this single tasking low memory
> beast to do it all as well as interact in an intra-net. Even without an HD.
who's fault?
The st was designed in like 1985. Dude! what do you really expect?
The OS only make it appear better. Although 520k of ram is still 520k of
ram no matter what OS you have, no matter how you want to look at it.
A TT/Falcon (or uptodate ST (with PAK or such)) with at least 4 to 8 meg
of ram should be our minimum.
Hey, guess what Quake III will not run on a 286 intel PC.
Surprising?

> >2)Development is different, in a good way I would say:

Still run them? such as?

> Hey, I will decrease the ante. I will give you an XTRA 1/2 Meg or Ram to
> make the program work. I have pretty much given up on the 520ST STOCK

> However, STing and any of the mailers, Antmail, My Mail should work.

to read your email, this was possible decades ago without mymail, antmail, amail etc. Just a simple telnet session. Your computer didn't even need to have 500K of ram, You can even do that with an 8bit computer.
Having a GEM interface is just more flexible and looks nicer. Although you are dealing with extra code, (slower and introduction of bugs). I think it is worth it to deal with a nice GEM interface, so I can deal with the consequences it implies. Although I made sure I have enough RAM and a nice screen resolution, faster port (>19200) etc.

>
> But really what we need is an internet midimaze, really we do! Only natural
>
> Is their Magic for the Hades?
in what way would that be different than magicpc? totally wasted money there. If you get an hades to run magic, something is really wrong in my opinion.

> Actually STing (well I use the old 1.08/12dialer) combo with Cab and Dans
> latest ovl, and it does take over the system, especially troublesome if it
> can't resolve the url. It is quite a wait and really the world is ending.
Is that an okay situation for you? can you live with that? I know it just pissed me off. SO I rather edit my own cnf files in an editor and no have to deal with the nice GEM interface, locking the system down. That's a choice.

> Well, I will be experimenting with your best in the coming new year.
> I just don't look forward to tar, gzip combinations and still haven't
> figured out how you guys format a drive in the minix format to get
> longfilenames, and I am afraid to lose all my current data on the hd of my
> TT.
to not loose your data, back it up. Then put it back after you have converted your drive filesystem.
To convert filesystem, it is really a no brainer to do it. 1 command line and that's it.
tar and gzip are actually great (imo), I simply assigned them now in THING, so I don't even need to deal with command line to just extract an archive. tar and gzip weren't really designed to singletos type OS, nor FAT filesystem. SO of course you are gonna run into problems.
I am not saying tar gzip is the best (rar might be better, I don't know). but it beats lzh or zip if you don't use FAT.

> All my STs have Magic. Call it what you will, I can't see any better multi
> tasking for an 8mhz machine. It blows away my old A500 I had.
>
> And even as fast as Magic/NVDI is, I still like old TOS and the LGD.
I understand that.
If you can live with all the limitation, I guess you are the happiest, luckiest person I know then :)

Limitations in the OS do imply limitation in applications. That is the thing you need to understand.

From: Katherine Ellis <kellis@fdn.com>
Date: Mon, 6 Dec 1999 17:00:55 -0500

Hi Katherine,

>Bengy, Dennis and others:
>
>Tell me what you think of a setup like that:
>
>a pentium 133mhz 128meg with magicpc 6.0 with nvdipc 5.x, with iconnect,
>cab and all latest with jinnee with a dual ISDN line.
I can't speak for Bengy, but the above setup is CRAP, and I think you now
that very well.... but I'm not a PC expert, why don't you ask Terry what he
thinks of it? you'll get an unbiased opinion and with a little luck he'll
show you some perspectives...;-)

>I know some people might drool over that setup.
Poor sods..., can nobody help them? Isn't there a specialised clinic who can
at least try to stabilise their condition?

>Lemme tell you, this setup really stinks, blows, pathetically sucks,
For once we agree :-)

>(btw, iconnect is as slow/shaky as stik was, so I really don't get why you
>guys get so exited about it). When CAB resolved, it temporarily "lock" the
>other connection, also slowing it down. Of course it can't be a setting
>problem, coz it is dummy-proof, And there is no such option anyway. So it
>is a design problem, But I thought I heard you said it was the best. Geez
>what a reference. Thank god I know what the best I can get on my atari is.
Hm, what do you expect me to say about this? if you think I'm gonna write a
10kb long reply, sorry, been there, done that..

1. What version of PPP are you using?
2. What CAB.OVL is used
3. Perhaps you should try to RTFM....
When using a ISDN-connection, you have to change the parameters in ICONFIG.
Click on "Profi mode".The default of the parameters give a good average using
a 33Kbaud modem... big difference, Kath...
4. If this setup is using HSMODA, you should raise the in and out buffers to
at least 32 KB in DRIVERS.PRG
5. What timeslice are you using for multitasking? it should be put quite low,
since that PC is crap, you have to give it crappy parameters...
5. If all of the above, doesn't work for you, nothing to worry about, thank
god you know what is best on your Atari... but if it's that good, why are you
messing with IConnect & CAB?

>Now as of today, machines, tos revision, multitasking, nvdi, g.card. This
>is not the same thing anymore. Writing something compatible is a bigger
>task than writing few lines. Programmers are actually starting to follow
>atari standards. (well, some people didn't really help (magicos for
>example messed my days many times, I just don't care about magic anymore
>to support).
Kath... let's go back to 1993... The Falcon was released, with a buggy TOS and it came bundled with something called MultiTOS, nice to look at in those days, but completely unusable...to slow, even on the TT (the flagship in those days) it was painstakingly slow. A clever German programmer decided to write a fast Atari TOS compatible multitasking OS. Magix actually made it possible to multitask on a 1040, without falling to sleep next to the computer... In the States Geneva was developed along similar lines...
MinT has come a long way the last 6 years, would you happily install a three years old version on your Atari? I think not... When I would install MagiC 4 I shall loose a lot of features, but it *will* run fast and rock steady...
I've made my choice in 1995, occasionally I install the latest MinT, to see what's happening.... I'm not blind, it's probably just as good as MagiC, and I'm sure it will even get better in the coming years.. it should, considering all those talented people that are helping with the development.
As the user I have different viewpoints as you the programmer... If I buy an application I want to make full use of it's features. Calamus, Papyrus, Jinnee, IConnect, Artworx, Papillon, Texel ...etc are all written with MagiC in mind.
Nearly all of the above mentioned applications will run happily under MinT, but where's the advantage? in my book there aren't any...
This is a cheap shot, but I'm gonna use it once again: where are all those applications written with MinT in mind? you know... spreadsheets, databases, wordprocessors,... etc. Please don't start mentioning the open sources, that *could* be ported over. Most of them will be too slow on a stock Atari...

>now you all want to push us to use magic? for that? please don't do
>that to me, your MagiCal world is probably taking off (see milan II with
>magicos, hadesmagic), Atari world as I know it, is ending.
The Atari World *WE BOTH KNOW*, ended in 1994...,since than we've had the Medusa, Hades, Milan and in a couple of months the MilanII and Phenix060. We're both still here, and if the roof doesn't collaps on my head I'll be here for many years to come...and somehow I think you will be around aswell.

Why is it, that every time something is announced that might be of benefit to a lot of Atarians (I didn't say ALL) you and you're gang come here crying out loud ? I don't see any reason for this kind of behaviour... Even if MagiC would be the most powerfull OS in existence, what's it to you? Mint/MintNet will still be here, it's not like some invisible monster is going to erase it from your harddisk forcing you to use something else, is it?

Your slogan tells us to "move on", we are, look at all the software, docs, help etc.. that has been released in 1999, we never had it so good...
Is the fact that a new version of MagiC will be able to address network cards so frightening? Why? they are building a road, just like the freeMint programmers, it might be two somewhat different roads, but at least they

lead to the same destination... Every improvement to the OS surely is a good thing, it doesn't matter which OS, it offers choice, and if the improvement is of any value it will be eventually added to the other OS aswell

What is so bad about MagiC coming with a TCP/IP IConnect compatible stack, it will not prevent anyone to use STIK/STING if they like this better. But for people who like IConnect and his clients, it means a bit less programs in the AUTO folder, and an even easier setup, so what? the world will not stop revolving because of this...

You know Katherine, I like the specs of the MilanII (with or without MagiC) and I like the specs of the Phenix even more... both these machines have got nothing to do with the Atari world as we known it, but supposing Atari was still around, I think they would both get the approval, both are worth carrying the Atari logo.

So why are you so pessimistic? things are looking good... two Atari clones on the way, real clones, no emulated bullshit. New software is developed, HP is going to bring us dedicated drivers for their printers, scanners, streamers, CD-RW...etc. USB drivers are written, we've never had it so good the last ten years...
All development for whatever OS in the long end will be of benefit to all of us, we've had this discussion before.... I rather see everyone here buy a Atari clone then running MagiCPC on a super duper whatever PC.. Why is it so hard to grasp for you that we're in the same camp? We fight the same fight, but use different weapons... I use the MagiC way, you the MiNT way... thanks to these two OS's we're still here.

Cheers from Belgium
Dennis

From: Bob King <robert.king@patent.gov.uk>
Date: Mon, 06 Dec 1999 13:08:45 +0000

Hi Bob,

>Dennis, as you know from my postings on this topic, I have been in the
>'give OXO a chance' camp and still say 'If you are genuinely hurt by
>Jo's remarks try to rise above them and develop for the English market,
>there are a lot of us out there'.
Bob, we're in the same camp, I want a decent fast browser just as much as
you and anyone else here.
I did not write that posting because they've attacked Jo, Jo is a big boy
who's perfectly capable of defending himself. Whatever it is that is
causing frictions between OXO and Jo, is not our business. It shouldn't be
a topic in this newsgroup either....

But, I don't like to be blackmailed, and that's basically what OXO is
trying to do...
<SNIP>
>>But, I think that this english version of WS will be the only
>>english version of any Oxo's softwares, because we have no
>>time to spend with someone like this "Mister Jo". We have
>>no plan to fight against persons who dislike us, or our
>>softwares. If You prefer CAB, or other, stay with them.
<SNAP>
If ASH, Invers, ROM, SysSol ...etc would have written something like the
above mentioned quote I would have done the same thing... I had to read it
several times, I thought my eyes were misleading me. The brutality of
giving "us" an ultimatum.... who the hell do they think they are... in a
way I'm suprised that it was only me who given them something to chew on.
Regardless if one likes WenSuite, I personally think that OXO's posting
was insulting to all of us...

>the number of dissatisfied FRENCH users 'six months ago'.
>Certainly, about that time OXO's presence on the 'Net vanished. Can you
>give some more precise details, as my postings on the French news group
>don't go back that far.
As long as I can remember, there have always been complaints and moaning
against OXO, in march-april it reached it's top. And OXO used a very
effective strategy announcing that they would stop all development on
Atari products and leave the platform.... unless the users showed their
loyalty and trust towards them. This had a very big impact, OXO is one of
the last French developers... postings started flooding in condemning not
only Jo, but all the other unsatisfied OXO software users... the French
newsgroup turned into one big flaming group, often gettting very personal.

This is exactly what OXO wanted... a camp with "believers", so they said that they were willing to give the Atari platform another chance, as long as the userbase didn't moan too much.
I only keep postings when they contain some usefull info, so no, I don't have them anymore either. Have a look at deja news... they will be in their archive.

>Perception is all part of the game of marketing a product and if it is >perceived, however unfairly, that OXO are just 'trying it on again', then >they will suffer.
Bob, this is difficult....
-In 1996 I bought WenSuite 2.4x at the Paris Atari show, it didn't work, I couldn't even use it for offline browsing. Upgrading to version 3.xx is free, so no complaints about that, but it still doesn't work. Except for a new interface, I've noticed nothing new in OXO. Reading the history.txt is very nice, but the main problem is that it still doesn't work... How much credit can one give? three years is a very long time...
Take a look at the RSC file, some functions present in the menu, don't even have a dialogbox yet... at the rate OXO is going, I'll have to give them at least another three years credit... sorry, I have a limit.

-I bought the English version of Papyrus a couple of years ago, I'm still waiting for the next update. Versions 6.xx, 6.5x, 7.xx and 7.5 have passed me by. Now there's version 8.0. Time and time again an English update was promised, it never made it... I'm still waiting.... if it makes it this time, will we have to wait another three years for the next update ? if it ever makes it, I wonder what the price policy will be towards updating thethree years old Papyrus 5.x

-Two months ago, I bought Draconis Pro, you've read my views on this piece of shit last week...

What I'm trying to say Bob is that consumers a very funny breed, some people just don't realise when they are taken for a ride... when one of the above mentioned products come with a new version number, people will happilly buy it...
I've given you three examples, but sadly the list is much longer... a lot of software isn't released in English... why does a MagiC, Texel, Kobold, CAB, ...etc user have to be content with "old" versions? The last commercial desktop that was translated is.... Ease 5.x !!,

The English speaking Atari community is being ignored and as long as only a couple of people complain about this nothing will change... we're a big group, we should start bombarding the softwarehouses and distributors with mails DEMANDING updates/bugfixes...

In a couple of months the MilanII will be released, do you think that all the bundled software will be in English and will be updated regularly? If we don't change our attitude towards dealers/softwarehouses/distributors nothing is going to change...

Lets's start a revolution... ;-)

Cheers from Belgium
Dennis

My experience was very frustrating but ultimately I got my items.
Over the past 2 years of getting back (getting deeper) in to the Atari ST MIDI/music world, I placed 3 different orders w/Tom. Each time I ordered more expensive items and each time it took longer to get my stuff. I finally received the Link I ordered about 6 months later after 10 or so calls, faxes and emails. Mr. Harker seemed mildly embarrassed at his company's lameness... This is sad because as I'm sure many of you know, the ICD Link2 (and I assume his other versions) works great!

Make that "on a stock ST" and I agree.

But, on a stock but fully expanded TT (10 MB ST plus 16 MB TT-RAM
was available off the shelf), anything is possible.

Example:

I have successfully ported SSH to plain 68000, so it can work
on an ST. Does it work? Oh yes. Is it usable? Hell no, it's
way too slow, even on my 25 MHz Stacy.

On the TT, it works beautifully. Even the daemon works well and
fast, as long as it is started standalone (i.e. from rc.net at
bootup, not on the fly from the inetd daemon).

> Is the fact that a new version of MagiC will be able to
> address network cards so frightening?

I'll believe it when I see it. The Riebl has been available for
ages, but was never supported by Magic. If it ever is, I might
even buy myself one copy of Magic, just to try it.

Hi Dennis, this is getting very convoluted!!! The part quote you give might give the wrong impression of my side in the OXO/anti war. My would be remark of 'If you are genuinely hurt by Jo's remarks try to rise above them and develop for the English market, there are a lot of us out there',is directed at OXO, not you or any other 'OXO-anti'. I myself am begining to have my OXO doubts. Perhaps, as a previous poster has surmised, OXO are using the ploy of sending out beta-ware and using us as the beta-testers. OK as long as we are not expected to pay money and if this is thier ploy, then let them tell us openly and we'll play.

I still have it and will be selling it soon. I have to go through it and make sure I've gotten rid of all personal items and I have to put together some text explaining its shortcomings (it needs a little work). I'll most likely be auctioning it on eBay, with a very low starting price, since I have no idea what it's worth (given the problems).

Hi,

It's a shame that the Milan hasn't officially reached the other side of the Pond yet.

I have heard from other industries that setting up distribution in the U.S.A is VERY difficult, so much so, that many smaller companies don't even bother as the overheads mean that their products become too expensive.

One British company I spoke too said that it was cheaper for them to send goods direct from their factory, and pay the postage, than it was to set up proper distribution in America.

Why not get together and order some motherboards direct from Milan Gmbh, you could assemble them with locally sourced case, keyboard, mouse, monitor, disk drives etc.

Alternatively why not try and persuade one of the US based Atari dealers to do a "bulk" order. If they are ordering, say 4 or more them it will be economical for them. That may get the ball rolling.

Regards,

Peter

Bob,

I am using Imagecopy 4.2b2 plus without any problems. Photoline TT
works fine too (overkill ?) I didn't have a Falcon only an ST and some
of my old graphics viewers didn't work as they used tricks to get
more colours on the screen.

Yes and "others", that is Terry and all.

> 5. If all of the above, doesn't work for you, nothing to worry about, thank
> god you know what is best on your Atari... but if it's that good, why are you
> messing with IConnect & CAB?
1) not MY machine.
2) when I defend something, I don't like talking out of my ass, if you
know what I mean.
So I need to see the latest and see what some magic users have been
bragging about.

> Nearly all of the above mentioned applications will run happily under MinT,
> but where's the advantage? in my book there aren't any...
book?
The clear advantage is that you run all that PLUS more. (not even counting
stability and speed, which I know some magic users will contradict).
I think this is a big plus.

> This is a cheap shot, but I'm gonna use it once again: where are all those
> applications written with MinT in mind? you know... spreadsheets, databases,
> wordprocessors,... etc. Please don't start mentioning the open sources, that
> *could* be ported over. Most of them will be too slow on a stock Atari...
I don't think you get the idea of what MiNT is.
MiNT is an extension of GEMDOS.
Now MiNT aware program we've got PLENTY. (over 800meg compressed of latest
unix port). For all AES/GUI stuff, it will be typical GEM. Papyrus on a
16Bit 1024*768 screen runs rather well in MiNT with all the unix stuff
running in the background, plus cab, aftp, amail etc. See the prob with

aftp and amail is that they used MiNT specific calls and interface. But of course they are so generous that they had to make a port for magic.
Of course removing some of the natural features. How many magic users are still trying to run it without a decent av-server or olga installed?
Not even talking about the socket ovl for sting.
CAB ovl is one of the things you are asking for. Obviously you need to check cab with different OVL. you will then see the "slight" difference between cab ovl iconnect and the mint one.

I don't like too much the "could be ported" obviously, you haven't kept close relation with development in the MiNT world. Which doesn't give you much right to talk about it. (see why I check magic/ magicpc?)

you could check sparemint. That'll give you a good start of what could be ported and what _HAS_ been ported.

> The Atari World *WE BOTH KNOW*, ended in 1994...,since than we've had the
> Medusa, Hades, Milan and in a couple of months the MilanII and Phenix060.
read it wrong I think: The atari world as "I KNOW IT". which gives another dimension to the sentence.

> Why is it, that every time something is announced that might be of benefit
> to a lot of Atarians (I didn't say ALL) you and you're gang come here crying
> out loud ? I don't see any reason for this kind of behaviour... Even if
> MagiC would be the most powerfull OS in existence, what's it to you?

Obviously you are missing the point.
FIrst of, let's start with the programers, eventhough you tend to not caring much for them, they are essential for a platform.
As of today, it is clear that you don't program on atari for money.
Coders either do that for their own needs, or sharing their creation with other people, or just by pleasure.

Now, when one sees "..and all MiNT Naes crap" what do you really think? who brought up this discussion? where these (unjustified) comments necessary? who are they trying to convince or to show to the world? are they trying to promote a company which I do not agree fundamentally with, and just putting down some people who do code "better" and more efficiently all for the better and not the pitiful money ash might be making.

Now ASH, or whoever, it is good that they are in business, that is good for atari community and all. Just that you don't have to be an asshole to "succeed". (atari terms= still being around)
If some atari users are actually happy with magic, very good. all for the better. Just don't think it is the only alternative, and the best alternative there is. Coz it ain't. Let's just put things where they belong. That's basically all I am asking.
These mysteriously mistakes (bengy that one is for you) such as:
AFTP, AMAIL: email client for STING in the magic page. (title before is something like, all magic clients or such).
Was it so hard to simply say amail is a MINTNET GEM client that has been

"generously" ported to work under magic. Is that really to hard?
Then it is funny to see magic users need change as magic is moving
"forward". like: "Blah mint with network blah whatever, don't need that,
we are on atari, we just need simple application, who would want to
network the atari anyway, and so on, blah ssl is not worth it coz most of
the page use javascript anyway, so totally worthless" That kind of
comments are just excuses. Who needs shared lib? who needs minix, memory
protection, ramdisk, symbolic links are worthless groups work as well some
say. This is just bullcrap, by either not realizing what they are talking
about, or just being ashamed that magic is always behind.
Oh yeah, got a nice experience with "TELI" whoooo the TELNET client for
iconnect. Now of course, telnet is an old protocol, who needs it right? (I
have heard that many times from magic users mouth, many times).

> Mint/MintNet will still be here, it's not like some invisible monster is
> going to erase it from your harddisk forcing you to use something else, is
> it?
if magic becomes the standard and remain as useless as it is right now.
crosscompatibility between tos/mint/magic will be gone. All will be magic
compatible and nothing else. So even if developers still use MiNT, but no
users. That means that everything is gone. Who wants to write a program
for no one to use? and that is sad.

> Is the fact that a new version of MagiC will be able to address network
> cards so frightening? Why? they are building a road, just like the freeMint
ouh, big deal.

> What is so bad about MagiC coming with a TCP/IP IConnect compatible stack,
> it will not prevent anyone to use STIK/STING if they like this better. But
> for people who like IConnect and his clients, it means a bit less programs
people don't "LIKE iconnect" they might like the gem interface to set it
up. They have no idea if they like the stack. They don't have to code it.
They don't have any security issue, they don't have networks, they don't
need to share drives etc. SO they don't know. All they see is a nice
interface, it worked connecting them to the internet, that's all they
know.

> All development for whatever OS in the long end will be of benefit to all of
> us, we've had this discussion before.... I rather see everyone here buy a
> Atari clone then running MagiCPC on a super duper whatever PC.. Why is it so
> hard to grasp for you that we're in the same camp? We fight the same fight,
> but use different weapons... I use the MagiC way, you the MiNT way... thanks

(EN)

If you happen to live within EU, surely you must have noticed
that your Atari currently has no font to display the Euro logo.
I have just completed an ISO-8859-15 (Latin 9) version of the
ConNect font that fills the bill.

Download it from: http://www.megacom.net/~q-funk/download/

NOTE: I haven't prepared any keyboard map (CKB or KBD) yet for
this but, if there's enough requests, I could easily modify the
one I made for my previous Latin-1 font.

(FR)

Si vous demeurez en EU, vous aurez sans doute remarquï¿½ que votre
Atari ne comporte aucune police qui inclue le symbole de l'Euro.
Je viens juste de terminer une version ISO-8859-15 (Latin 9) de
la fonte ConNect qui remï¿½die ï¿½ ce problï¿½me.

Tï¿½lï¿½chargez le ï¿½: http://www.megacom.net/~q-funk/download/

NOTE: Je n'ai pas prï¿½parï¿½ de table de clavier (CKB ou KBD) pour
accompagner cette police mais, si il y a suffisament de demande,
je pourrais aisï¿½ment modifier celle que j'avais faite pour ma
police Latin-1 anciennement.

Hypothetically, would you have purchased an inexpensive '060-based Milan
if they were available in North America?

I can't help but feel that the Atari world these days really resides
across the Atlantic. That might sound strange or be misinterpreted, but
it's how I feel sometimes. Ironically it was in the next province over
from me, in Alberta, where there existed a Hades dealer (Computer
Direct). But they're out of business.

> necessity.

True. But personally I could still live without JavaScript and fancy
plug-ins. It really depends on what sites you're reliant on. There's
something to be said for the barebones utilitarian aspect of the Web
(not that JavaScript can't be utilitarian). I found that the novelty of
all this "new" stuff wore off quickly -- speed and reliability were the
biggest factors.

> Is IE 4.5 the latest version on the Mac? It's up to 5.01 on the PC, and 5.5
> is supposed to be released any day now.

Yes, IE 4.5 is the latest for Mac, although 5.0 should be available any time now. Note that IE is developed separately between the two platforms, unlike Netscape which is developed concurrently. For instance, 4.5 for Mac has some CSS support that's not in 5.0 for Windows, so the version numbers don't have the same meaning as they do with Netscape. To be pedantic, the Document Object Model (DOM) for the two IE versions is considerably different.

IE for Mac also has some external differences, notably a download manager and a web archive feature (for downloading complete sites in one file); and there's good use of the Mac's drag-and-drop (which isn't so evident in Netscape for Mac). Netscape is more of a generic port, whereas IE isn't.

> something like, all magic clients or such).
> Was it so hard to simply say amail is a MINTNET GEM client that has been
> "generously" ported to work under magic. Is that really to hard?

Kellis,
In the INTERNET section of my *MagiC* support page i have aFTP. It says:
ï¿½aFTP ï¿½aFTP 1.54b, English A nice FTP client for STiK/STiNG.

Simply because it is the Sting version. Now sure, it is has been generously
ported to work under MagiC. But Im not going to say that in the download
bay. They are just brief descriptions not complete history's of the program.
You make it sound like im trying to hide the fact. .

I've done much business with them, always get the items in good
time and in good shape (packed well). The only time an order
was not filled was when it was an imported item like a CD-ROM
from over seas. So for me SFT is trustworthy.

hi!
A friend of mine is sending e-mail back and forth to Danish
friends/relatives around the world.
He is having a problem with his friends receiving his e-mail using
the Danish character set, and vice-versa.
Is there a font one could use that would allow International
characters to be used, such as Danish, so the umlauts, etc would not
be lost in transit.
I remeber seeing a similar discussion on German characters but I have
forgotten the resolution to that problem.
any help appreciated.
oh, the 8859-1 refers to what my friend sees in the header as a font

Sounds like you have the wrong page size set - either in Timeworks
itself, or a dip-switch on the printer. It would help if you said which
printer you are using...

Source record: 69241

On 2 Nov 1999 02:52:37 G, Jeff Armstrong wrote:
:Now I have read that Geneva is a multitasking AES, but I'm a little
:confused. Is this AES replacement still supported by the author
:actively?

yes. it is an AES replacement. use nVDI with it. Dan Wilga is not as
active as he used to be, but I've heard of a realease 007 being
released in Germany. (english is version 1, release 006)

:Also, will this be a sufficient multitasking environment?

it is a very sufficient multitasking environment! You can set up
flags for individual programs, for instance I turn off multitasking
when I run 2in1. I am running it right now in Thing with CAB,
POPwatch, NEWSie, COPs, and taskmanager open.
Runs almost everything I've tried, in fact I can;t think of anything
it doesn't run that I use. That may be because I no longr use
anything that doesn't run with it! :-)

:Lastly, will it work with the Thing desktop using multitasking or
:should I spring for Neodesk also?

Thing is excellent, with AV support better than Neodesks. I do love
the icons on the neodesk windows though. Neodesk is slower though,
but super configurable! I've yet to learn/use all the features of
Neodesk!

:I'd mostly like to know a little
:more about Geneva. Doesn't seem to be the most popular of the
:multitasking systems. Just wondering how it does on its own (without
:MiNT).

It is more popular in NA I think than Europe, which is a shame. I am
hoping to get the Geneva programming docs up on the web soon for any
hary soul/d that would like to translate it to German! :-)
I figure if Magic docs can get translated to English, Geneva docs can
get translated to German!

:Any help is greatly appreciated! Thanks in advance!

Yes, nothing wrong with NEWswatch or POPwatch. Just to jump in here.
See previous posting regarding 1meg and I think this is where problems
occur. Now if using NEWswatch and POPwatch in Single tasking can you do
both?

Yes, you can download mail, get news and FTP all with NEWsie and even
get some primitive webbrowsing done all in one program all at the same
time if using Geneva, Magic, Mint with GlueSTik. Not with Multi Tos
however:-). I don't believe it is STing happy.

Well you can read NG Online with NEWsie. It just seemed numerous times I would get on the internet, and remember a message someone wrote in the NG regarding a webpage or downloads or tech tip and I would realize that I couldn't read them as NEWsie would default to looking online for files to be downloaded offline.

However, I may being doing things wrong here, and I have not been testing with Magic, but everytime I start going between online and offline readings with STing loaded I get corrupted xover.txt files. So in truth I could probably have better results if I was webbrowsing and loaded up OKAMI just to read the messages I already received. But that is another day.

>>a Tos window. This is all working fine for me now;-).
>
>Great! Tell us what you did to get it to work!

Umm, Ok but I don't what to get to technical for all the interested readers.

I simply downloaded the latest version off Dan Ackermans ANTHILL INDUSTRY homepage. It simply loaded the very first time. Last time it would load, flash something and disconnect me followed by a pair of bombs. From there, not even knowing what Micq was, is or does, I followed the MICQ HELP link on Dans site using CAB and filled in the necessary details, along with typing help alot and often and in many was until I figured out how they wanted to have things sent. Oh, sorry not to confuse, I am reading the webpage while MICQ is loaded and then filling in the forms such as update etc.

Soon after this I called a friend and told him the ICQ # sent to me and he contacted me. After numerous foolhardy attempts to send him a message back, I figured it out.

And now alot of my valueable time is wasted in another internet manner.

Now what I would like to know is if Micq can be used as a desk accessory like the Atari IRC program? Good for single tos.

Anyways I was really really happy to have it work, although chatting really isn't my bag. But there is alot more it can do too.

I am certain a Gem interface would be handy, but even an incompetent person such as myself should be able to get by with the online help.

So, there isn't anything magic that I did:-), just double click.

I am using Geneva release 005. I have just downloaded the upgrade to 006 as I am sometimes in the dark about things that happen in Atari land even if it is 2 year old news.

What I would like to know is if this update will bugger up my settings on the hard drive. Geneva came with the Falcon I purchased, so since I haven't installed the original program myself, I am always scared about these things. It works real nice right now, which is why I don't want to mess with it. However, since I have been unable to get the Latest Taskbar to

work, (two Bombs) I think I may be in need of an upgrade. If anyone has Taskbar running on Geneva please let me know as well.

Otherwise I update this weekend, and I could lose everything with my clumsy paws.

Later Brian.

>Or is it simply impossible??? I'm very curious!
>
>.

Dear Jos,

the problem with Wensuite seems to lie in the Script compilation (taking for granted you have got the registration key). Oxo say that, if setting up the Script button in the PPP link Dial Up Options on 'auto', you should connect in most cases but this is only true if you receive 'Login' and 'Password' as actual requests from your provider... If not (e.g. 'User name' and 'Password', that is similar BUT NOT THE SAME), the 'auto' configuration can't work properly. So, try to know exactly what the remote modem asks for (by running a terminal program like Connect); then write it in the PPP script with the correct spelling (case sensitiveness...) and the correct answers. Set up the Script button above on 'manual' and this should work at last (the whole procedure is explained much more minutely in one of the Wensuite help *.htm files). Good luck.

Marco

One problem though. The most German software publishers doesn't respond to mails coming from outside Germany. Why?
Furthermore AFAIK the English version of Papyrus 7 including the docs were ready long before the Stafford show, so why forbid Ulli Ramps the selling of Papyrus 7 at the Stafford show?
At the Hannover Messe I've ask Ulli why the English version wasn't at the Stafford show. He said that due to the huge work involved with organisation of the Hannover fair (plausible answer) he couldn't be at the Stafford show. He also said that the English version was ready indeed but that the release of it was postponed because the docs weren't proofreaded yet. He also said he was looking for a English guy who could do this for him.
I told this to a English friend (hello Paul) who offered Ulli his help.
AFAIK, my friend never recieved an answer of Ulli.
I really can't understand this kind of behaviour.

3709. Floppy Drive/MagiC Problem?

Newsgroup: comp.sys.atari.st
Date: 1999-12-09 00:00:00 UTC
From: s.barbieri@ukf.net
Message-ID: <385021b1.0@news2.cluster1.telinco.net>
Source record: 69051

Hi Everyone,

Have been using MagiC (6.01) now for a few months and find it great but just recently have come across a strange problem. While backing up my system recently to Zip something happened to my SCSI chain and damaged/corrupted most of my data. This then prompted me to back up to floppy. After a while I noticed that after saving to floppy if I tried to access the disk to check it, some files had turned into complete unreadable rubish or were not accessable at all. Repeated attempts since have brought about the same results but I find I can make the data readable once again via a reboot. I am using top quality 720k DD disks that are pre-formatted for IBM PS/2 & compatibles (Bought from System Solutions - the same disks they use) and are not a problem with TOS 2.06. The drive has never been a problem when using TOS 2.06 so it seems to point to MagiC but could it be that I need to format all these discs again via the MagiC format. Has anyone come across this before?

Any thoughts would be welcome - Please no "Change to MiNT" ones thanks ;-)

Regards
Sean

3711. ARCHIVERS (which one to use?)

Newsgroup: comp.sys.atari.st
Date: 1999-12-09 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <82p57e11ss@enews3.newsguy.com>
Source record: 69053

This was posted a while back by me, but I never saw it come up in NEWSie,
and doing a DEJA search yeilded nothing either, so I'm reposting it:

~~~~~~

On 28 Oct 1999 04:14:30 , Neil Roughley wrote:

>Try Christian Grunenberg's LHarc-Shell 3.1. It's AV-aware, so files can
>be dragged and dropped directly onto the interface -- much more

>of them being that it can also output self-extracting archives.

Years ago I used to use the archiving shell that was built into Freeze Dried
Term (ARC, LZH, ZIP). It did the job fairly efficiently.

But the last few years, I've been using a little program (I _think_ I got it
on a magazine cover disk long ago?) simply called ARC-UTL.PRG.

It requires setting up a small info file that tells the program the locations
of your various archivers, as well as the parameters needed to extract from
each. It would be a little daunting for the beginner to set up I suppose, but
once it's done, it's a simple matter of dragging the compressed file onto the
program icon, or [in my case] just assigning ARC-UTIL.PRG as an application
under MagiC for all the various archive fomats, and then simply double clicking
on the ZIP, LZH, ZOO or whatever file to uncompress it.

My .INF file looks like this:

```
-----------------------------------------------
ZIP,f:\compress\stzip_26\zipjr.ttp,-xr,1,NO
ARC,f:\compress\arc\arc.ttp,x,2,*
LZH,f:\compress\lzh\lzh_3_1\lharceng.ttp,x,2,NO
LHA,f:\compress\lzh\lzh_3_1\lharceng.ttp,x,2,NO
ARJ,f:\arc\un-arj\unarj_je.ttp,x,1,NO
ZOO,f:\compress\zoo21\zoo.ttp,-extract,2,NO
END
-----------------------------------------------
```

Of course it only _EXTRACTS_ the archives, it doesn't create them. For that
you need a shell (or use the TTP version and enter the appropriate parameters).

I'll make it available on my web site if anyone wants it.

3712. PageStream Fonts: convert to NVDI/GDOS?

Newsgroup: comp.sys.atari.st
Date: 1999-12-09 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <82p57901ss@enews3.newsguy.com>
Source record: 69054

I was wondering if there was any way to convert a PageStream font into a GDOS/NVDI or TTF?

I have _so many more_ PageStream fonts than I do GDOS/NVDI fonts, and a lot of them are quite nice. There are a few in particular that I'd like to make use of in Positive Image 2 with some graphics for my web site.

So far the only way I've been able to make use of them is to create a PageStream document containing the font/text I need, then "print" the PageStream document using the STraight FAX printer driver with PageStream; which "prints" the document as a FAX file that is then imported into STraight FAX, and resaved as an IMG or TIF file for use as a normal graphic in Positive Image 2.

Of course any scaling or resizing brings out the "jaggies" since the font is now essentially a bitmapped graphic.

Any ideas, or am I comparing "apples to oranges"?

Havn't tried another type of cartridge but I have bought a large refill
bottle from another souce along with the syringe to sqirt it in. It is a
lot cheaper and I have re-used the current cartridge 10-12 times so
far. Can't tell the difference between a refill and the genuine one.

I am not really over the moon with the quality of my printer either it is
a 4300. I reckon a new ribbon on a dot matrix is almost equal to it

I've used AW for three or four years now, keeping track of my
business's clients, generating written correspondance, etc. It's nice
being able to plug in a client's specific details into what is
otherwise a form letter. Yes, I really like the database. I don't
use the spread sheet much, as I have little use for it (I use Phasar
for accounting).

The only real niggle I have is that there were some non-standard calls
written into the code, which do not correspond with what NVDI is
expecting. It took me a while to figure out the margin settings for
both portrait and landscape printing, but once that was done, I've
never looked back. I am upgrading to the newer version of NVDI soon,
and I expect that there will be some issues getting AW to work
properly with the new software.

I'm in the USA and I registered Thing directly with the author Thomas
as he accepted US funds. He promptly sent me the key when the
payment arrived. Thing is a great program, so don't be worried
sending the small amount he asks for registration over seas. I sent
him extra because it seemed to low an amount for the quality of the
program. ;-)

Stick with Geneva for now, it's probably the most stable and compatible
AES around. Pair it with Thing or Jinnee and you have a *very* competent
OS. I have been using both Geneva 006 and MagiC 6.01 on my TT (to test
Taskbar), and I'm generally very pleased with Geneva. It works
surprisingly well with MiNT too, I haven't had any problems yet.

Here's something to get rid of some of the bitterness. BTs latest attempt at dodging the flak is to offer a new package, BT Surftime, that allows upto a 24/7 connection for UKP34.99 inc. VAT. The only trouble is they're not going to introduce it until Spring next year :(There's more info about it on their site

Hello Brian,

BVT>What I want to know is if anyone has used the Database extensively to
BVT>realize its limitations.
I used to use it extensively, but don't know the limits. I imported
from a DBMAN database and added records afterewards as usual.

I am able to edit, to sort. I did not try really to print. In order to
get a multi index sorting (more than one field to sort after, like a
phone book, e.g.) I provided a mulit-index myself.

If interested, mail to me individually!

Hi Jon and Chris!

What a coincidence: on a rainy day in december i'm having the same trouble: coverting ST imagefiles to PRG's readable for my ATARI 1040. I tried Chris' advice: I downloaded HD-COPY and Makedisk. I succeeded in Formatting a 720 KB to 800 KB. So far-so good. But I couldn't quite get the hang of Makedisk. How do I put an .ST file from my PC-harddisk to the newly formatted floppy?. I tried all kinds of commands in MAKEDISK, but they never seem to work. Maybe i'm not that good in DOS. Do I have to read the .ST file first and then write it to disk? Maybe you could help me?

Lots of thanks from holland,

herm

>thethree years old Papyrus 5.x

As many will know I DTPed Atari Computing from #8 to #16 using my own
personally bought copy of Papyrus 4 and despite us showing ROM a copy
of the magazine at a German show and telling them that we were happy
to use and endorse their product and show other people what we could
do with it, they never sent us a review copy of later versions of the
program, despote a couple of half-hearted promises from them. Even a
German copy would have been something. Their No-show at the recent
ACC'99 was the final straw for me, I've decided to to spend the money
I was going to use on upgrading Papyrus on something else.

It's a great shame, but the poor attitude and lack of will given to
getting English language versions of certain software out is very
quickly killing enthusiasm from even some of us die-hard users.

:-(((

Best wishes
Mike Kerslake

I believe those virtual drive files come with the software write-protect flag
set. Right click on the VHD file from wINDOWS and deselect Read Only. Then
run Gemulator and use the GEM desktop to copy files from the A: drive to the
virtual drive.

It's been such a long time, but I remember Laser C didn't work properly (or parts of it) under Atari TT. I had used it under Atari ST (TOS 1.04) and had to switch to Lattice C for programming on TT. Do your problems occur with TOS 1.04 or just 2.06 - that may be a cause!

Joseph Zorzin <redoak@forestmeister.com> wrote in message news:384D707D.1264E7A2@forestmeister.com...

I downloaded all 6 parts of the doitf030 files, at 14.4k, now stzip asks for a password!

I can see zipping the files, but locking them up with the need of a blasted password to unzip them? What's in them ? CIA files?

>>sent the e-mail too, and the actual post itself being filled with ">" due to
>>multiple reposting/quting by the previous M$ product users, the e-mail is about
>>10 times the size it should be in the first place!

>FYI, most PC users hate that, too. With a passion.

Those in the KNOW do. Most that I've dealt with have no idea how to get
rid of the excess garbage in a message, or stop their chosen mailer from
sending HTML along with the text and automatically generated DSC files,
or realize they're sending all their _plain ASCII TEXT_ e-mail in MIME
format.

I've got nothing against PCs. I use my roomate's every now and again,
and will eventually need to get one myself if I want to stay current
with technological advancements; particularly with regard to the web and
HTML. But I guess coming from an Atari background, I've gotten to know
more about the "workings" of computers in general, which is something that
a lot of current PC and MAC users never learned, since those two platforms
do most of the work for you.

I don't think these people deliberately intend to exceed 80 columns, post
HTML, or include their entire forwarding e-mail list with every e-mail
they send, or quote your entire post/e-mail at the bottom of their message
- even if they aren't directly referring to anything in it. But given the
way the software keeps much of this information "hidden" from the
inexperienced user, we are often forced to put up with it.

>(Also, M$ products aren't the only ones that do HTML email/news.)

Absolutely correct. I would say, however, that the majority of the people
violating these rules of proper "netiquette" use M$ products, simply
because they are the most popular, come with the machine, and the
average users aren't aware of any alternatives.

Here in Los Angeles, there are a number of computer radio shows on the
air. And listening to the incredible ignorance of most of the callers,
and their complete lack of basic computer knowledge amazes me. It's no
wonder we have to deal with these sort of "netiquette problems"! I
certainly don't blame the product, just the user of the product -
regardless of the computer platform.

Just while we're talking about Atari dealers, I'd like to put in a good word for chro_MAGIC. (http://chromagic.digistar.com/) Though it's a small operation, Irene and Jim seem to be very well organized. I didn't a response at all from such small shop (fearing they had gone under), but I was pleasantly surprised by the 1-2 day maximum wait when I made contact.

I asked Jim about upgrading to MagiC 6.1 English and he answered promptly and politely. Keep up the good work!

Derek

P.S. They haven't received MagiC 6.1 English just yet. =)

Isn't Jinnee available in English? It also takes time/money to
translate a program and if there are not enough customers... of course,
companies think twice before starting a translation or searching for
distributors if the Atari market outside their home country looks
(more) fragile.
Your idea of writing to the software publishers is good. At least it
would help them to estimate the number of active English-speaking Atari
users.

A lot of people wouldn't take the time to register such a package, and I think it is Roberts way of tracking his package. John does it with NEWSie, but incorporated the feature within the application. Just email Robert, and he will send a password promptly. I don't know of anyother person that has taken the time he has to assemble such a package for the Falcon (or Atari in general) platform. One hell of a guy! (now send me that 15 marks Robert:).

Well, today I ripped apart that 286, hard drive was/is dead I think, old st-151 mfm drive. Might keep the 3.5 floppy as sparre parts. The power supply was built as part of the whole machine, not removeable like other's I've seen, ut I can still rig something up, and the wires are red/black/blue. Will have to hold off until I can get a multi-meter to check the volts with.

One less bubblegum machine in this world. when I phoned the companys tollfree number I got almost to the point of talking to someone live, that was until the answer system said there would e a $45.00 cost for the call.

No wonder they can sty in opertion. But not from me they don't.

John,

Honestly... I don't know about the arm breaking or anything, but I'd just like to see something done. I even emailed Tom and said in so many words "look, send me some alternative hardware to make up for the Catboxes and we'll call it even" No response, nothing. I'm sure if I emailed him and said "Oh, gee I'd like to buy some stuff, should I send me Visa # to you???" I'd get a response back in a heart beat. Someone has to go knocking on this guy's door and face to face have him resolve this problem, him taking more money and hurting people is not the answer and now everything that ICD was has gone to sh*t, even the whole deal with ICD selling off the whole 8-bit section to Mike Holman from Fine Tooned Engineering went sour too, the only benefit any of us have gotten is we could probably all infringe on all of the ICD patents blatantly with little fear of either Tom Harker or Mike Holhman ever doing anything about it because they'd have to face criminal charges for mail fraud and anything else that can be slapped on the table for all the money and equipment that have borrowed, taken and stolen from so many in the Atari community.

One final word, anyone belly acking over prices from B&C, Best or Video61 should really tone it down, they are it for us, our only sources for hardware, software and support, so enjoy them while they are still around, cause one day they too may disappear and that'll be yet another door closed.... and Ebay's closet/basement finds will dry up too so we'll all be left out to dry.

|quickly killing enthusiasm from even some of us die-hard users.

I agree, to some extent. That is to say I have been looking forward to English upgrades to Papyrus for some time, and have been disappointed at their non-appearance. On the other hand, ROM Logic have been moving Papyrus to the pc and they have been developing Papyrus Office and I suppose they themselves don't have time to do everything. Indeed, it might not be them but their UK distributers who are responsible for the non-appearance - I don't know.

I tend to be an optimist and I understand that Office is going to be available for the Atari and in English and I am content to wait. One thing that I am using regularly is the Papyrus 7 demo as it handles long files properly. Version 5 will not redraw correctly when text in a long document is changed (by long I mean 300 pages or so). So I do alterations with v7, save it and print it with v5.

Mind you, when I read what I have just written and think that a word processor will not display long documents correctly, it _is_ disappointing. The only thing that cheers me up is that I heard that one of the main word processors on the pc is even worse.

On both. I've tried just about everything. At first I couldn't get Laser C to open any files, or create a new one- and even trying to have it save a new config.sys file for Laser C would crash it out. Then, I discovered that by lowering the ram to 4 megs from 14 overcame those file loading and saving problems. Now, Laser C comes up OK, loads the compiler and linker OK, can load or create a new "c" file- but if I ask it to compile the file- it brings down my entire system- crash- the black screen of death and I have to reboot.

The author of the program insists that it should work, but has given up on helping.

But someone else here did explain on how to use the virtual drive (that it comes write protected so I couldn't load anything into it). I'll try running Laser C from that and see what happens.

Yes, I've had nothing but great dealings with Systems for Tommorrow in
Independance Mo. I've even been to the store a couple of times to
shop thru items when I've been home on leave in Kansas City.

Kent is very good and I feel very trustworthy, which is becomming hard
to find this day in the Atari field. (ICD problems in previous
posts). He was open like 5 days a week last I checked (Closed
Sun/Monday) and open Tue-Sat like 10-5/6 pm. Sometimes takes
awhile for him to answer e-mail. But normally get a good responce
once he gets to them.

Howdy folks

Anybody know if one of the programmers guides Canon is so willing to sell us for to much money is also available on the net?

BTW mine is a BJC4200 and it sucks at EPSON emulation.

CU Mathy van Nisselroy

PS anybody ever tried ink cartridges made by different companies?

PPS this message is cross posted. Please stay on topic or delete the newsgroup(s)

>who are responsible for the non-appearance - I don't know.

ROM have been promising for a couple of years now an English version.
Every time you check their web site there's an occasionally updated
message saying that the program is done, just the online help needs
finishing and it will be ready soon!

I understand that System Solutions are the new distributors,
presumably for the English language version, rather than just the UK
version - but don't quote me on that.

Hopefully, this means that the product stands a chance of release some
time, but seeing how long it took for Artworx and jinnee to get
released in English, I won't hold my breath waiting! ;-)

>I tend to be an optimist and I understand that Office is going to be
>available for the Atari and in English and I am content to wait. One
>thing that I am using regularly is the Papyrus 7 demo as it handles

I fully understand the complexities involved in releasing software,
and the hassle WRT translation and printed manuals, but AFAICS later
versions of Papyrus have apparently been translated to English, and
the online help just needed tidying up. So if this is true I cannot
see why it still hasn't appeared, even if there is a later German
language version available.

>long files properly. Version 5 will not redraw correctly when text
>in a long document is changed (by long I mean 300 pages or so). So I
>do alterations with v7, save it and print it with v5.

I found a number of problems with v5, which is why I stayed with v4,
even though I would have liked a few of the features in v5 to make
life easier (guides etc).

>Mind you, when I read what I have just written and think that a word
>processor will not display long documents correctly, it _is_

And, apparently, v5 misses out huge chunks of text when spell
checking! I can't verify that because the program usually crashed on

me before I got to that stage in text preparation! ;-)

>disappointing. The only thing that cheers me up is that I heard that
>one of the main word processors on the pc is even worse.

PC software is pretty poor TBH in my limited experience. StarOffice is quite nice but it lacks some features that come as standard with Papyrus, and it's not particulary stable on my system. Can't speak for Micro$oft WP/DTP products as I swore never to use them if at all possible. And if anyone thinks that most PC 'net software is better than Atari stuff then you're wrong. NEWSie is easier to use and configure than Agent, Pegasus and Outlook Express. Agent is clumsy and basically crap at handling multiple accounts, NEWSie is a total breeze in comparison. And Agent cannot handle a newsgroup file listing with more than 65,000 entries! OE's usenet handling is unbelievably slow, and guaranteed to make you throw it out almost immediately!

Personally I cannot wait for the next version of NEWSie. The current version is moreorless solid on my system, most of the serious bugs in earlier versions look as though they have gone and in ease-of-use and general behaviour it's better than PC equivalents. The only major disadvantage with NEWSie is that you cannot mark message headers for later retrieval offline, something that Agent has and is useful. If John gets around to sorting that out then I'll be very happy.

Best wishes
Mike Kerslake

I would tend to agree that the majority of netiquette faux pas are committed by M$ users. Considering the sheer numbers of M$ users Vs the rest of the products used it would make sense. That doesn't include the M$ push to rope in in-experienced and new computer users. So the biggest group of inexperienced users are with M$.
Now the winner for low IQ user of the millennium goes to the M$ user who called her local computer shop telling them she needed her coffee cup holder fixed. You know the one with the button that shoots out of the front of your PC.

Hi Uwe,
Took me since 1987 to get a HD for my ST4. Been saving to 720k floppy
(plenty of time for tea, vacuuming, truck tune-ups....). Sounded like a
good buy so I got it. Still makes me appreciate my Falcon! No magic
and TOS is 1.02 (I believe). Wonder if it's software upgradeable and now
on to AHDI utilities! Came loaded with a bunch of oldies but goodies!
After a few boot crashes, I found that after eliminating the ACC's it
booted OK. (maybe due to TOS version or HD configuration?).

I found this Magic Sac+ cartridge from Data Pacific mixed in among a bunch of Atari 2600 carts at the thrift store, though it's obviously for an ST. Label says "Turns your Atari into a Mac". However, my 520ST boots up the same as always even with the cart installed. Does anybody have any info on this thing? Thanks,
Ron

You can use a SCSI-I with an adapter called "The Link". Perhaps
SCSI-II with "The LinkII" but I'm not sure about that.

That's not my problem. The problem is, when I use Geneva, mICQ just displays a 'M' in the GenevaTOS window and gives me some bombs right away. It only works if I switch GenevaTOS's settings to single-tasking, which kind of puts some limitations on what I want to do. The only other thing that works is using Geneva with Mint, which isn't a permanent option for me yet.

So what I was asking was, how do you guys get it to run under Geneva? What Settings do you use (i.e. the ones for each individual program set through the Task Manager ACC)? I've had some other little problems with it as well, but I want to get it running uder my normal system first before I get into those. Thanks in advance for your feedback!

Agreed. I have been saving up for a number of things to upgrade my system, including the long-promised Papyrus 7 English version. I E-mailed ROM a couple months ago about it, and they sent me an E-mail telling me to keep an eye out the next couple weeks. A couple months later, I still haven't seen anything. Being the eternal optimist that I am, I still am hoping they will pull through, but I'm not putting *complete* faith in it. I just wish there was another alternative to AtariWorks. It's served me well for years, but it is quickly showing its age and is missing a number of key features that I'd like to see in an Office-type suite. The Demo of Papyrus 7.x was quite impressive, and seemed to have what I'm looking for. I hope they get on the ball and realize that there IS a non-German Atari market out here!

ROM--- Are you listening?!?!?!

>AFAIK, no.

I wish more demos were made available for things like this. The demo was what made me want to choose Geneva over Magic (aside from the price difference) a couple years ago. Now from what I've read, Magic is faster and has more features that Geneva, but I could tes Geneva and see for myself. As it seemed to work extremely well, and I had (and still don't have) any clue how Magic works apart from hearsay, I chose Geneva. I think a demo, although a little more effort, gives your software a definite advantage, at least for those of us who take the "seeing-is-believing" route.

Mike Freeman
nameerf@flash.net

P.S. - I've never been disappointed with Geneva, and would recommend it to anyone! Try it with Mint 1.15.5, Thing 1.27, and Boxkite! It's faster that Geneva/Neodesk, and gives you long filenames and Mint software compatibility! Once I can figure out how to register Thing and Boxkite from the US, this will be my permanent setup!

P.P.S. - Once I register, Thing and Boxkite will be further proof of the advantages of creating demo versions!

->economical for them. That may get the ball rolling.

I've inquired a couple of times with one of the best Atari (US) dealers,
Systems For Tomorrow. If SFT can't do it, then I'd almost be willing to
bet that it can't be done. So far, no luck. ;-(

Thanks for your reply.

There was a program called PCG Font Designer that let you convert
Pagestream Fonts to Postscript Type 1. You might need something on another
platform such as Fontographer or a PC with NT installed to get them to
TrueType from there

I'm thinking about uprading to a falcon or TT as i realise that my mega 4 is getting a bit long in the tooth.

Which is the bet? I have always fancied a TT but the falcon sound hardware.....

Is the TT substantially faster than the falcon?

TIA for any comments.

Niall

3771. Re: TT or Falcon?

> I'm thinking about uprading to a falcon or TT. Which is the
> best? I have always fancied a TT but the falcon sound
> hardware..... Is the TT substantially faster than the falcon?

That question has been asked several times. Here's my view:

TT:
---

* 32 MHz CPU and 16 MHz bus
* includes 68882 FPU as standard
* 4 serial ports (including one RS422 compatible with Mac)
* VME bus (for Ethernet or graphic cards)
* ACSI and 25-pin SCSI ports

Strenghts:

Networking, UNIX environment (using MiNT or Linux), DTP (using
the 19" monochrome TTM194 or TTM195), CAD, MIDI scoring (19"),
software development.

Weaknesses:

8-bit sound (like STE), limited screen res / palette ratio.
somewhat incompatible with some old ST software.

Falcon:
----

* 16 MHz CPU and bus
* no FPU (socket is empty - FPU must be added by user)
* only 2 serial ports
* DSP 56001 (audio/video calculations)
* programable video chip
* 50-pin SCSI2 port

Strenghts:

Multimedia applications (audio recording/editing, raytracing),
game development, almost completely backwards-compatible with
STE software/hardware.

Weaknesses:

Buggy SCSI port, serial port stability affected by overall bus
load or selected resolution, various motherboard and TOS versions
all have their own quirks that make it hazardous to decide wether

to install certain accelerator boards or wether certain hardware-
dependant software will run correctly.

***

Overall appreciation:

If you make music that includes sampling, are a graphics designer
or demo coder, or absolutely need compatibility with most games
you have accumulated from your STE, buy the Falcon.

If networking, Linux, Ethernet, maximum expansion possibilities
and sheer speed attract you, go for the TT.

Brian Millson (BMillson@csi.com) wrote:
: Does anyone know what happened to Computer Direct?

: Brian Millson

We had dealt with Chris Chrowchuck at Computer Direct and bought some software off him, he seemed like a nice guy and in the Atari community there is a degree of friendship and trust,
being on an enthusiast platform.

However, a friend in our club paid Chris NZD2500 in instalments to buy one of his T60 computers - heavily advertised in the magazines, he was about to make the final instalment and take delivery of this amazing computer, but then, no matter how hard he tried, he could not contact Chris at all either phoning from New Zealand or Faxing.

It is one of the sadder things I have come across in the years I have been with Atari computers, that someone you almost regard as a friend, then actually robs a mate of $2500 - I
mean - did he want a loan or something - then he should have asked.

What Chris did was NOT contact my friend at all, NOT a boo or a whisper, NO explanation, NO apology, NO nothing. He wouldn't stand up and be counted, he just chose to disappear and Chris, if you are reading this, then I tell you - we know that this was just an easy thing for you to do. You are in Canada, we are in New Zealand. Very convenient for you isn't it, where it is hard for us to follow it up.

We still are relying on your human conscience to contact the well known Tariland Computer Club here in New Zealand to offer an apology and explanation.

In fact, Chris, what would be better is that you did something absolutely pure and simple - PAY THE MONEY BACK - WE ARE WAITING AND HAVE BEEN WAITING FOR A WHILE NOW AND WE WILL NOT FORGET WHAT A COWARDLY THING YOU HAVE DONE - DO YOU KNOW WHAT YOU HAVE DONE TO OUR CLUB MEMBER AND FRIEND - ROBBED HIM BLIND OF $2500 - IN OUR COUNTRY WE CALL THAT THEFT. WE TRUSTED
YOU WITH OUR ATARI BUSINESS AND WE EXPECT TO BE TREATED RIGHT.

Recently our friend did voluntary work in the country of TURKEY where they had the devastating EARHTQUAKE, just to show you how far you can also go CHRIS to putting things to rights.

I urge all those reading this post to this distribute this message widely and if you know where he is, then send Chris this post and urge him to face his conscience and reverse one of the more despicable things that have been visited on the Atari fraternity.

We are still feeling the pain and financial loss of an Atari dealer that blatantly and extensively advertised (double-page spreads in the magazines) only to then do the "dirty" on

his customers.

We are waiting....

Dennis,
As an semi-educated guess, if you intend to run 'both' machines
simultaneosly make sure the power supply can handle the total current
or it's blown!!! There also may be a reason for separate 5v lines (?).
The type of ground should be looked at also (floating, chassis or
neither). Don't get zapped!!!!!

Niall,

> Is the TT substantially faster than the falcon?

Definitely. The TT030 also has room for an internal 3.5" SCSI hard drive and comes with a professional keyboard, plus is designed for up to 26MB of internal RAM (using Atari's standard upgrade boards -- or even more using a 3rd party upgrade board). The math co-processor is also standard in the TT030, and it supports the 19" Atari TTM high-resolution monitor as well as several resolutions of color.

On the other hand, if you're primarily interested in playing games and color graphics, the Falcon might still be a better choice -- there are very few games that will run on the TT030.

Yes, quite possible. The reason there are multi connector feeds for 5v and ground is to guarantee the current carrying capacity. As far as I remember the 5v and ground currents are around 2-3 amps so any decent "mains-type" connecting wire would do.

I'd recommend running multiple +5 and ground wires to as near the Falcon as
you can, because it will help overcome voltage drop due to wire resistance.

The jinnee 2 RSC files and bubblegem help file in English are available for
download from our web site.

Coming soon will be RSC files for Texel V2.0.

Jeez, so what's all that stuff on their web site saying they've got two or three English speakers working on the help docs then? :-(

>I told this to a English friend (hello Paul) who offered Ulli his help.
>AFAIK, my friend never recieved an answer of Ulli.
>I really can't understand this kind of behaviour.

After well over a year of this sort of behaviour I have reluctantly given up on waiting for a new English version.

I'm still happily using v4 on a day-to-day basis, but the upgrade fee has gone on a proper DTP program for the PC ;-(

Hey, I've got to earn a living somehow!

:-)

Being the eternal optimist that >I am, I still am hoping they will pull through, but I'm not putting >*complete* faith in it.

That's the attitude I've taken for too long now, laying out AC was becoming a grind without some of the improvements in later German versions but I struggled through to the end, but as I've got new work starting soon I need a package that saves me time and hassle and v4 of Papyrus just doesn't make the grade. But saying that, for a document processor I think it's a good program and only it's graphic handling really lets it down big time.

>I just wish there was another alternative to >AtariWorks. It's served me well for years, but it is quickly showing >its age and is missing a number of key features that I'd like to see >in an Office-type suite.

Strangely I've recently bought a copy of Atari Works from HiSoft (actually two copies - one was for a friend!) at a very reasonable price. If anyone wants to buy two copies or more it might be worth your while contacting HiSoft direct and seeing if they will deal! :-)

I've not had time yet to really play with AW, but I like some of the features in it, so when I have time...

>The Demo of Papyrus 7.x was quite >impressive, and seemed to have what I'm looking for.

Yes, I really wanted to see ROM get a new version of the program out in English, but why oh why could they not arrange to have it out and available at Stafford!

>I hope they get >on the ball and realize that there IS a non-German Atari market out >here!

There is, but frequent delays are bound to diminish it further :-(

>ROM--- Are you listening?!?!?!

There's a strange silence......

Does anyone have a up-to-date BBS list for the Atari computers?

I'm in Indianapolis, Indiana, and I can't seem for anything find
the number I had to the Crossroads BBS here. They had decent content
and I was on it about 7 months ago, I'm sure its still up and running.

Just need the phone number to it. Used to be in the Computer Users
but they took the section out due to the internet"killing" bbs's.

altho, that doesn't apply to most Atari BBS's.
(from what I know at least)

any help would be appreciated!

Thanks in advance.

Hello everybody,
Here is a new version.

It only contains bugs corrections.

For those who never read the documentation:
'-videomode <n>' to choose a video mode for the Xbios, from the liste
displayed at start.
'-zoomscreen' to activate full screen mode.
The 320x200 game screen is zoomed to fullfil the screen.

> I was wondering if there was any way to convert a PageStream font into a
> GDOS/NVDI or TTF?

From memory I think Pagestream uses Postscript (type 2 ?) fonts and I'm
pretty sure newer versions of NVDI support this format too.

I strongly suspect that there will be some sort of conversion program
lurking on a ftp site, but off hand I can't think of any names.

Another alternative would be try one of the many font archives around --
such as,
<http://www.flash.net/~fontahol>
and see if you can match the fonts you want from there...

M > have just installed it and played with it enough for the last
M > few days to realize that I really like it. I didn't at first,
M > but it has grown on me. What I want to know is if anyone has
M > used the Database extensively to realize its limitations. Any
M > information is welcome. Same goes for the spread sheet.

I have not used the Database, but the spreadsheet can be maddening
to the point of uselessness. Works fine if the sheet is small, with
very little calculation required, but when it gets bigger, it starts
giving you noise about 'formula is in wrong format', even though it
is in fact okay. Quitting and reloading will eventually stop this
nonsense for that load, but another load or some further work will
go back the the same old *&^(. For serious spreadsheet work I am
using KSpread4, which also has fairly hideous problems, but at least
it doesn't drive me crazy. And it has at least one feature
(resizable boxes in both axes) that is unavailable in AW or LDW.

The wordprocessor works fairly well, especially useful for very
rudimentary dtp. I prefer PageStream, but have no fonts for PGS that
include the upper character set, which I often need (I teach
apprentice electricians).

... I didn't make a mistake. The computer misunderstood my request.

I was just looking at the 286 I ripped apart and my Falcon. I see that the falcon's wires are, the blue is 12vdc, with the red being 5vdc and the blacks are ground.

The pc has the same color, but I've got to check with a multi-meter for the voltage.

Now, I'm wondering, could I just run all those ground wires into just one? Only one 12vdc line, so no trouble there, but multi 5 vdc, so maybe I can run those off one 5vdc line too?

I agree, of course they don't do it intentionally. Back in 1988 when I came to this NG, using a terminal program that allowed me to exceed 80 columns, boy would I hear about it. Ouch:-). People don't intentionally fart (ok some do), but one does excuse oneself to be polite. I'll I am asking is that we try to accomodate everyone here the proper way and not the M$ way.

I am not using any special settings whatsoever. It is just a basic Geneva installation, although I never installed this version myself. It came with my falcon. I will try MICQ on my TT Geneva setup later this weekend.

I hope you have the latest from Dans page. Just get the program files only. I think there was the extra files that Micq creates, I would let it recreate them. I figured my file was somehow corrupted. But I am not really certain.

Anyways, no special settings. I am not that technical yet:-).

>have any info on this thing? Thanks,
>Ron

I would just drop it off a large plane:-).

Magic Sac is one of the first Mac emulators for the Atari ST. You required the Mac roms , 64k, for it to work. It doesn't read Mac disks you have to transfer the software to a Magic (OH NO) formated disk. Magic being the Mac emulator format and nothing to do with the Magic OS.

This software was later superseeded by the Spectra GCR which used 128K roms and could read Mac 800k disks.

Hope this Helps.

M$ Internet News 1 User
Gnu5.7/Emacs 20.4 1 User

79 Users in Total. Time frame of about 1.5 days.

A few assumptions are Pine users are using Ataris, Don't know about Tin.

Atari Users

NEWsie, Pine, Okami, Ash.

= 34 Users

The rest of the world

= 45 Users (its a very small world out there:-).

I just happened to recall someone stating that 40% of the users in the NG use MS OUTLOOK EXPRESS.

A number of things can be foolishly concluded with these data.
On this particulary News Day.

40% of the posters use Atari Software.
Lots of Sunny People like Mozilla as well as Pentium People.

There were more people using Pine then I thought there would be.
There were less using OKAMI then I thought there would be.
Under 13% use MS OE.
There were more NEWsie Users then I expected.
I have no idea what Micheal Schwingen (spelling sorry) is using?

If I missed anyone, well, you were probably over 80 columns and I just deleted the information. I think this would account for 30% of the missing M$OE posts;-p. Just kidding. Leave 80 columns for that other great thread:-).

I am positive I won't be doing this again. If anyone doubts my figures I do not stand by their accuracy. I do not defend them, I don't even say they are correct. If someone else ever can't get to sleep at night and counting sheep doesn't help (never did help the Scottish, only gets them excited), I suggest you try doing a larger sample and spend time looking at threads you don't normally read just to see what reader people are using. I just realized how many posts I simply delete with little regard for their content. But reading posts you aren't interested in will definitely put you to rest.

I have no Idea what SSL and SSH stand for. I do know that the CAB.OVLs
that I have for STing and the OVL. that are available for Iconnect don't
support this anyhow. In this case my ST does the same as my TT and Falcon.
If I use Mint, there is no difference as I am told these sites require
Javascript. Until it is implemented for the Atari, it is a moot point.

Magic runs on an ST, CAB, STing, Iconnect work on an ST.

>I had this discussion a couple of days ago with Bernard Diotte of

>hesitation, Berny conluded that the TT should now be our minimum support
>base.
>IMHO, he is right. The ST has limitations and we must upgrade to
>something more potent as a minimal support level.

Well, that is a good opinion for him. I hope that he imports Milans. A TT
is near decade old. It was late when it came out and was behind all others.
The Falcon isn't any faster than my ST, only prettier:-). These are some
pretty dated technology and not much better than my ST.

I will start a new thread elsewhere perhaps.

But one can't deny that Magic supports the ST . Makes it
multi task and makes it fly. Sounds like good news to me. Built in
networking in the OS? Sounds good to me, especially if I can get these
vapourware ethernet adapters and hook my STs to my TTs and Falcons.

As it is I can do this with STing.

I can do this now with Mintnet, but clearly an ST is in over its head for
Mint Applications.

Minimum support level?

I think it still exists for the ST, how much farther who knows. I could just imagine if someone had told Alexander Claus, to not waste time trying to make CAB work on an ST. I am sure he was told this. I can just imagine if Peter hadn't developed STing to work on the ST. I could just imagine if John Rojewski hadn't developed NEWsie to work on an ST. Family Tree is another awesome program that works on TOS 1.0 and every other OS. He could have released it Falcon Only and Magic Only but he didn't.

And this is where my argument ties back together. You want universality for all but not necessarily everyone. I simply say, if it can be supported on an ST then DO SO! If it can't, then reality prevails.

All these programs work on 1MEG ST with TOS 1.0 and UP!!! Not Bad in my book.

CAB latest software is 2.8 and released in Fall of 1999. Pretty current release for a computer you suggest should not be the minimum. I like getting stuff that works on the ST.

There are things an ST just can't do! But this has nothing to do with whether is should or should not be the minimum base level computer to support.

Now for the really important stuff. Does Microdell have a web page and what stuff does he have available for Atari? This may be the best news I have heard yet.

Later Brian.

You don't have to think to hard really. You just mention that there isn't
enough Gas in the Tank.

> Yes people are disapointed and just blame it on
>"ATARI Computers" when indeed. Atari can do it.
>Just not the ST.

An old tune, sung previously when the ATARI ST could do it, more, faster
and better. It is a compromise. I am here on an ST because someone told me
in no uncertain terms that you couldn't get a PPP connection and go Surfing
with an 8mhz ST. I proved him wrong and got 1 year free internet access out
of the deal.

>That is a big difference to me.
>And watching some people busting their butts (Milan, Medusa etc) trying to
>keep up with technology. People still use their ST, yet still complaining
>about the lack of power.

Who's complaining? I believe however that the same can be said for the
FALCON AND TT owners. You never have enough power. I don't even think that
the Hades, and Milan are powerful. These are obsolete technology, very old
technology while other computers push for the magic GIG.

Doesn't mean I won't buy one of these computers over the superior
horsepower.

>Now I understand that 3000 USD for an Hades60 is a tad pricy. And defeats
>the whole purpose of Atari spirit (power without the price).
>But Milan conserves this ideology pretty well.

I could own either, I am sick person!

>> As a lowmemory ST owner, sometimes even Magic w/o NVDI uses to much memory
>> to Web Browse. But STing still allows for this single tasking low memory
>> beast to do it all as well as interact in an intra-net. Even without an HD.

>who's fault?
>The st was designed in like 1985. Dude! what do you really expect?

Not complaining, I am praising! Their is no fault here and I don't know how you assume I was placing any. This is my point. You point out how ASH ties up the market and I provide a better alternative for low memory STs in Single TOS.

>The OS only make it appear better. Although 520k of ram is still 520k of
>ram no matter what OS you have, no matter how you want to look at it.

You brought up supporting 512K in your original reply, I actually gave you an xtra 1/2 meg;-). Any ST can have memory added to it. An ST with 512k wasn't logical after 1986 in my opinion.

>A TT/Falcon (or uptodate ST (with PAK or such)) with at least 4 to 8 meg
>of ram should be our minimum.

IYHO. Certainly for any Mint Users. The minimum system is the one you want to use. 2 Meg ST ram in the TT SUCKS. My TT is 2/4 and it runs out of memory more often than my ST, running the same animations I created.

To me the minimum system for Atari Users hasn't been built yet. The Hades and Milan are so far behind it is laughable. Will they handle video streaming? There are many Web current Web features they will never be able to handle. The minimun Atari System will come in the second wave of Milan computers, the next, development which will be far more modern. When, who knows but if people buy the current milan they will certainly buy its successor.

I know what an ST can do. I put this poor baby through hell.

>Hey, guess what Quake III will not run on a 286 intel PC.
>Surprising?

Won't run on my TT/Falcon or ST either. But I would never ever bring in a helpless pile of toro kaka like the 286 to influence my point. The question is could it? The answer is yes for all answers. An MSTE with VME NOVA GRAPHICS card, out performs a Falcon. You can develope hardware for any computer including the lowly ST. When I had an Amiga in 1990 we had a device that plug into the video port to create a simulated 262,000 colours. This device could easily have been adapted to an ST. Unfortuneately, I have been thinking about this device for a few days now and can't even remember its name. It would add remarkably to CAB on an ST or TT without Graphics Card. If their is an application, be software or hardware, and their is a demand, someone would make it happen no matter the computer. I am reading about a video enhancement for the ST in the tech section. And clearly an ST horsepower can be increased, as you say to a PAK 030.

No need to respond to this, unless you wish to apologise to the crippled child mentioned above:-). Like a 286 has anything to offer against an ST.

>> >2)Development is different, in a good way I would say:
>> >At the time there was not much softwrae, so anything had to be done, with
>> >very little restriction, with very little hardware constraint. So writing
>> >plenty of nasty code was very fast.

>> Got lots of software to attest to that fact:-(.
>Still run them? such as?

Yes, Many, In fact I didn't have any modern software until I got the Falcon last year. This is how I got the unregistered Magic 4.0 and NVDI 4.0 So I installed them on my ST and watched programs crash. Soon after I have a collection of every Atari Made and every TOS. But my 520ST that I purchased in 1985 stays pretty much unchanged except for a 2.5 meg upgrade I installed in 1987 to run my SLM 804.

My old favourite is Wordwriter. The Dictionary doesn't work on the TT or Falcon. Lots of WPs out there, but like some users who enjoyed STwriter, it just happened to be my first WP. Doesn't like multi tasking in magic.

However the important stuff that I continue to use.

Cyber Paint.
Cyber Studio
Spectrum 512
Cyber Control

Luckily the best Cyber Sculpt works on everything but doesn't like Multi Tasking.

Clearly other users have no intention of leaving Notator until the ST burns up in a fire.

>> Hey, I will decrease the ante. I will give you an XTRA 1/2 Meg
or Ram to >> make the program work. I have pretty much given up on the
520ST STOCK >> internet possibility. (It still could be done but what would
it do:-). >> However, STing and any of the mailers, Antmail, My Mail

>amail etc. Just a simple telnet session. Your computer didn't even need to
>have 500K of ram, You can even do that with an 8bit computer.

Yes, and I did it when I could in 1988-90 when I would use Uni Term and make long distance calls to McMaster University. That was when Usenet was considered second class to the SIGs in Genie and Compuserve. However things change and imagine my surprise when told that local providers only provide PPP.

>Having a GEM interface is just more flexible and looks nicer. Although you

>opinion.

It was merely a question, asking if it was available because if every piece
of software ASH distributes is Magic only, then they are fools to exclude
this market of REAL power users.

>> Actually STing (well I use the old 1.08/12dialer) combo with Cab and Dans

>pissed me off. SO I rather edit my own cnf files in an editor and no have
>to deal with the nice GEM interface, locking the system down. That's a
>choice.

Well, it is the only situation for me:-). Each version of STing and the
accompanying overlays seem to have reduce the number of failure top
resolves but when you get one that hangs you live with it. I have seen the
same from Explorer.

And what do you do about Java enhanced webpages that don't let you see the
page? You live with things to, just to be able to use your atari.

>> Well, I will be experimenting with your best in the coming new year.
>> I just don't look forward to tar, gzip combinations and still haven't

>> longfilenames, and I am afraid to lose all my current data on the hd of my
>> TT.

>to not loose your data, back it up. Then put it back after you have
>converted your drive filesystem.

Yes, I know, I am just not looking forward to setting aside the day to fill
floppies. And I have a number of backup software that I haven't tried yet
for the Falcon. With my ST and SH204 it was simply, get turtle going and
swap the disks in and out and in about 1 hour you were done. To many megs
these days:-). I would back up to the syquest but I just don't trust it.

I also like doing backups while using TOS and not any alternative OS,
because I just don't trust anything other than Murphys Law.

>To convert filesystem, it is really a no brainer to do it. 1 command line
>and that's it.

Better be because I don't have any.

>tar and gzip are actually great (imo), I simply assigned them now in
>THING, so I don't even need to deal with command line to just extract an
>archive. tar and gzip weren't really designed to singletos type OS, nor
>FAT filesystem. SO of course you are gonna run into problems.

Actually TOS 1.0 using TTP isn't Gzip friendly.

>I am not saying tar gzip is the best (rar might be better, I don't know).
>but it beats lzh or zip if you don't use FAT.

I have always wondered what rar is. I have just ran into a few of these.

>> All my STs have Magic. Call it what you will, I can't see any better multi
>> tasking for an 8mhz machine. It blows away my old A500 I had.

>> And even as fast as Magic/NVDI is, I still like old TOS and the LGD.

>I understand that.
>If you can live with all the limitation, I guess you are the happiest,
>luckiest person I know then :)

Thank you and I am. I am the happiest luckiest person that you know:-).

>Limitations in the OS do imply limitation in applications. That is the
>thing you need to understand.

Absolutely.

3810. Technology and the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1999-12-10 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <Kd144.22$Uo3.187@198.235.216.4>
Source record: 69086

This is a little tune that I hum. It is me waving the flag, carrying the banner, whatever have you.

I would like to use this post to talk briefly about the minimun spec Atari that should be supported.

I am of the opinion that if you get an ST user onto the internet USING and ST, this ST user will have a good chance at becoming a TT/Falcon/HADES/Milan user in the future. The ST can get you on the internet. The >60000 computers enhance this experience. THere is no argument here.

What occured in my case was that I had left computers completely by 1992. I really hadn't used my ST alot other than for DTP, CyberSculpt and WP. I later gave my ST to my nephew who used it for School and going on BBS. During this time the internet changed dramatically. I had no idea whatsoever, as to how much it had changed. I used the internet with Uniterm in 1988-9.

In 1997 and 5 years away from computers and roughly 7 years away from Ataris, my nephew asked if I could hook up an ST to the Internet. I said, of course I can, without any idea if I could. I couldn't figure out why terminal programs didn't work. So I went down to the IP and learned about PPP.

I asked a friend of mine to who lived 2 hours away from me to see if he could find Any Atari internet software. He was a PC user who had never seen an Atari. Thanks to the Good layout of Flinny STik pages, I ended up with an assortment of software to sit at home and think about:-).

Like, would it run on an ST? What is Magic, What is Geneva, What happened to Multi Tos, what is ST GUIDE, HS MODEM, and finally, what the hell is web browsing. Did I say I lived in a Cave?

So I read the docs,(you read these things when you are not on a NG. I found this newsgroup to be a crutch, now that I am on it), and I figure no problem. All I need to do is find Xcontrol. And I never had ANY BELIEF that if this software did work, that it would work on my TOS 1.0 ST.

In one day I had STing 1.06 connected. Yup at 2400 baud. Then I popped in the floppy disk with CAB 1.5 on it. Put on the proper overlay and viola. IT WORKED. I was web browsing at 2400 baud to a floppy disk. My god was this slow! What happened to the internet, things used to be so fast I thought to myself. I still wasn't certain what was going on, but soon I had a webpage downloaded, gif animations and all of my IP providers Webpage.

Now this wasn't pretty, and I had been bet that a 12 year old computer couldn't web browse on the internet. I had faith in my favourite computer, just to say, hey PAL, while you bought your 8088, 286, 386 then 486 and finally a 166 pentium, (oh did I say he has a 450MHZ now) to use the net, My lil old ST JUST GOT ON. But I wanted more speed. I thought the problem was the floppies, so I decided to create a cache in Ram. My 520ST had a 2meg upgrade in 1987, (he didn't know this, but he doesn't know anything anyway, so piss on him:-), however I discovered this wasn't the way to go.

I was hooked now, I found my SH 204 shoebox and installed all the internet software. There were numerous HD failures, (40 folder bug hits REAL FAST on the internet) Like in 1 to 2 pages, and it can be deadly. I had 40 folders set to 600, and this was peanuts. Regardless, I knew the limitation and also realised I used far less folders with graphics off.

So the time was ripe, My IP gave me as much time as I needed to sort things out. But in 48 hours I was ready for a short demonstration and 1 year of free internet access. I still didn't know anything about clients, and I didn't have any. No FTP, No Mail clients and No NG. Just a Web browser and with this web browser I found everything else I needed for my beloved little ST. What a great purchase this had become. Something so old just gave me $60.00/1 year of free internet service. What a way to realize that you have absolutely no regrets in a computer purchase made 12 years ago. The ST is DEAD? Kiss my Ass it is. For me My ST finally came to life.

Each day was another bet and each day I had something from free coffee and donuts to $5.

1) Bet it can't display a bitmap?
Of course it can I say, now, what are you talking about?
2) Bet it can't show a JPG?
3) Bet it can't use IRC
4) Bet it can't show this porno.
:-) ;-) ;-P , well I guess it did.

And the list went on and on and each day I searched ftp sites and found more and more. Possibly some of the best software I had ever come across for the ST came out long after I thougth the computer had little real value.

But the truth is the ST with its whole 8mhz can do ALOT. I left it with my nephew for the 1ST year and I came over just to download this NG and find out EVERYTHING about EVERYTHING. THis group is LOADED with information that is incredibly well rounded. I simply wanted to know what a zip drive was:-). Being a computer addict and at one time owning over $150000 dollars worth of computer equipment, I stayed away from them like a recovering alcolholic stays away from booze.

But thank God, for my ST, because clearly I have fallen off the wagon. January of this Year I purchased a used Falcon with Tonnes of original software. I paid more than I should have but I prefer documentation and originals. Especially being so dated. 3 to 5 months is a long time in the computer industry, 7 years is enormous.

So what is the logic of this post. It is that because programmers have made it possible for an Atari ST to get on the internet like modern computers do, I have continued to be and Atari User. I purchased a TT in August, and now have a tonne of STs that many people here see as less than the minimum.

Well, I can tell you this. If the ST is the minimum then this is
a good thing because there are other Ataris to migrate to.
If the ST is no longer considered the minimum, then Only TT and Falcon users will be migrating to the more powerful clones and MACs with Magic.

ST users will be getting on the Internet with a PC because they will believe that there Atari can't do it. Nowhere but here is someone going to tell an ST user he can get on the internet. Especially in the isolated locations that many ST users are confined. There are no dealers, and often no other users. There wasn't anyone for me to talk to about Ataris until AFTER I got on the internet. If a former Atari User gets on the internet with PC it is highly unlikely that their contact with other Atari Users will be for anything other than "how do I run Pacifist".

Why would a PC user want a Hades or Milan? Certainly not for the internet when they have something superior. It would have to be one very very very dedicated Atari user who takes this backward step. It is highly unlikely.

But an ST user can continue using his ST and be part of the community, get items such as IDE drives, accelerators and possibly a vapourware ethernet adapter, and hook his ST up to Cable. I would do this:-). Or this user will upgrade to the 030 and above computers that are available. Used TTs and Falcons aren't alot of money.

Then they can run the greatest multi tasking software ever developed for any computer.

But for the time being we must make contact with the inferior ST user who sits in his house, types letters plays games, and asks questions like can my ST play mp3s.

The answer is no, but you can hook it up to the internet and then you will find alot of other things that you can do with your ST.

And then he will buy the falcon to play the mp3.

Signed...

520ST User 2.5 meg of Ram, TOS 1.0, NEWsie .96b, CAB 2.7Demo, aFTP, FracIRC MICQ #57168164, STing 1.08/1.12, sh204 ,slm804.

>What Settings do you use (i.e. the ones for each individual program
>set through the Task Manager ACC)? I've had some other little
>problems with it as well, but I want to get it running uder my
>normal system first before I get into those. Thanks in advance for
>your feedback!

I am not using any special settings whatsoever. It is just a basic Geneva installation, although I never installed this version myself. It came with my falcon. I will try MICQ on my TT Geneva setup later this weekend.

I hope you have the latest from Dans page. Just get the program files only. I think there was the extra files that Micq creates, I would let it recreate them. I figured my file was somehow corrupted. But I am not really certain.

Anyways, no special settings. I am not that technical yet:-).

3812. More Atari! Inventory Growing! FREE Atari Computer Catalogs!

Newsgroup: comp.sys.atari.st

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

(Update: 12/09/99) I've just added more 8 Bit Software to my Catalog. Financial, Budgeting & Print Shop Software. As well as some Spoken Languages and a few Games. I've added another set of shelves to hold it. Also I was holding some software for a customer but due to lack of interest that Software is available again (Archon, Seven Cities of Gold, etc.). Most of these additions are $5 a pop.

(Update: 11/18/99) I've just added more 8 Bit Software to my Catalog. Programming Languages & DOS's from OSS, HOFACKER, Alpha and even Atari MicroSoft BASIC & Atari LOGO. Lots of Utilities & Copiers like Chipmunk and Impersonator. My Catalog is growing by leaps & bounds.

(Update: 11/04/99) I've just added a bunch of Titles to my Atari 8 Bit SoftWare Catalogs. All Games!!! A number of them are UnOpened! Many for only $5 a pop! And I went through my Catalog and did some adjusting of prices. Right now my 8 Bit SoftWare Catalog has a bigger Byte count than ever.

Atarians Unite! Are you pining for the days of a simpler Computer? Do you miss Arcade Classics like Asteroids, BattleZone, Joust, Missile Command, Robotron 2084 and my favourite Star Raiders! Well Bravo Sierra Computers has them. Are you wandering, wandering in the desert of violent video games. Games too violent for children? With Blood & gore? Two companions of youth nowadays. Especially those you hear about in the news who kill fellow students at school. If your preferences for games lean more towards family friendly. Like it used to be. Try some of my Atari Arcade classics. I have oodles of Atari SoftWare! As well as truckloads of Atari HardWare. And Libraries of Atari Books. Reference material and things you thought you'd never find! So come check it out. The best of Classic Atari 8 Bit & Atari ST. E-Mail me at

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tonight!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, January 13th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

3813. [HELP] PC-Speed installation instructions

Newsgroup: comp.sys.atari.st
Date: 1999-12-10 00:00:00 UTC
From: french-lines@usa.net
Message-ID: <82r45vvmj1@nnrp1.deja.com>
Source record: 69089

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

3814. HELP: MegaST2/4 Internal Info needed

Newsgroup: comp.sys.atari.st
Date: 1999-12-10 00:00:00 UTC
From: grh@hinton.demon.co.uk
Message-ID: <B47695D8966857F63@0.0.0.0>
Source record: 69090
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,maus.sys.atari.hardware,z-netz.rechner.atari.hardware

Can anybody answer the following?

What pins on the 68000 is the Atari fitted piggy back pcb soldered to and
where is the flying wire to the main board soldered?

(This pcb needs to be restored after an unsuccessful CPU upgrade)

Excuse me? It was ahead of equivalent Mac products back then.

> The Falcon isn't any faster than my ST, only prettier:-).

Pardon? It has a 16 MHz bus and 68030 CPU. Definitely faster.

> These are some pretty dated technology and not much better
> than my ST.

Dated, according to what? Overclocked 8086 sold as PentiumIII?

Anyhow, TT/Falcon are much better than the ST, actualy.

> Minimum support level?
>
> I think it still exists for the ST, how much farther who knows.

Not for long, even for Magic.

> I simply say, if it can be supported on an ST then DO SO! If
> it can't, then reality prevails.

And so it does. Most recent applications that have a 680x0
target require 68020 or better, because some CPU instructions
did not exist prior to thta CPU.

Which applications are you talking about? Most recent applications I
know also work with an ST. There are only a few that require an 68020.

> just to say, do not rule out the humble ST quite yet, Mario
> Becroft is working on a hardware project

Quite honestly, how many people will buy it?

Listen, Mario produces great hardware and software. No doubt.

However, remember that most ST owners bought it only because they needed a cheap MIDI sequencer package. They are using a Mac/PC for Internet and almost everything else. This also means there is _no_way_ you will never get them to buy anything new for their ST anymore; they would rather buy a CD-writer for their PC.

Those who really use only Atari for _everything_ use a TT, Falcon or a clone (Medusa, Hades, Milan), nowadays.

IMHO, the market is divided in two extremes, nowadays:

1) People who keep their old ST for games or MIDI, because their ST cannot do Javascript nor Ethernet, so Atari is really dead. They have seen the light and are happy to report that Atari is "outdated, slow technology" just because their ST didn't cut it, even though TT and Falcon owners report that their machine does indonesian coffee and heavenly connections just fine.

2) People who realize everything is just a matter of software, as long as their hardware base is potent enough. Those people have bought a TT or Falcon to replace their STE.

Group one thinks it might be fun to upgrade from a floppy system running TOS 1.xx to finally experience TOS 2.06 and hard-disk. They also probably want more than 4 MB of ram, so they can load _all_ the Cubase module and have plenty of room left for sound editors, in multitasking under MROS.

Group two wants 3-D graphics in their VME slot and Ethernet thru a cheaper alternative than hunting down a Riebl, plus a scanner and cd burner on their SCSI port, and finally a good PC keyboard and serial mouse.

Group one really doesn't want to pay for anything, because they got their ST for peanuts, in a pawn shop or at an auction.

Group two is willing to pay, as long as they get exactly what they want to get their TT/Falcon to perform what they need.

Mario (or yourself) may think differently, of course. ;-)

Anyhow, this was just my two markka.

Um... Once again, I think you are still overreacting. Saying
"assuming they are still in business" doesn't mean anything other
than the guy honestly isn't sure. No "hints" or anything. With the
Atari market the way it is, especially in the U.S., companies are
dropping off quickly. It just a fact of Atari life here. No one can
assume that a company IS in business any more. So calm down, dude!

I promise I won't go into anymore than this final comment:)

Ok, maybe here is why I have flown off handle lately, or as some
posters have thought, post abusive, non-constructive post.

1). Gemulator. My main gripe about this topic in the C.S.A.ST is the
first word out of each users mouth is "Derrick cannot answer my
questions, offers little support other than 30 pages of documentation
(that no one reads), or "ignorant" (thanks Bill P.) questions like
"does Apex Media work with Gemulator?" The latter question does not
even deserve an answer, and the user really needs to go back and take
a look at a few FAQ's (thanks Nick B.) to really understand what they
are asking. Number two on the list is "where can I get TOS ROMs?", and
ones like "what FTP site is Geneva on?" ranks a close third. If
Gemulator needs a home, then let the PC users create one, right
beneath alt.barney.die.die.die and both PC and Atarians interested in
emulation can beg, borrow, steal and whine all they want within that group.

2). PC envy. Nobody here has it, but PC and Mac users (X-Atarian or not)
continually think this an arena to debate how much better new PC and Mac
hardware is over TOS hardware. There is a vast difference in technology.
When someone like myself makes a statement like "Adobe Premier on a
PIII 500 with a Miro DC030 capture card sucks", compared to a Falcon040
using Apex and Expose, the PC and Mac types jump on Bills podium (he
owns both) and spews lines of text they know nothing about. In this
instance, the guy had a stock Falcon (Nemesis doesn't count as any
dedicated Falcon owner made his own "speeder" a long time ago), didn't
have fast ram, a graphics card or video capture device. He cannot
fully appreciate the performance of a Falcon 040, then goes on to deny
any problems with his new platform when when thousands (yes, I know
that millions of copies of WinXX have shipped) do have problems. This
tells me that this new PC (Mac) user is as ignorant (thanks Bill P.)
about his new system as they were about their TOS platform. Then
farther go on to criticize the arrival of the Milan 060. They have no
idea the performance of TOS based applications running on an 060
connected to a decent bus, not to mention the level of complexity is
much less on the Milan than a Win or Mac O/S based machine. Why does
installing a Jaz on a PC (or Mac) require 10 megabytes of zipped
driver software from Iomega when on a TOS machine only requires about
29K of HD Driver? The "other" systems are galaxies apart, and it is
senseless to debate (in this newsgroup) the pros and cons of each.

The guys (or KEllis) with the TOS machine do not need ANY input on how software or hardware performs on a PC (or Mac).

3). This could all be solved by revisiting a subject that came up here a long time ago, different newsgroups. Look at the Programmers group under C.S.A.P. They have a very quiet, productive group. Questions are answered, examples posted, and everyone helps out. If the Internet can support 13 variations of alt.barney.die, then it can support comp.sys.atari.f030 (the Germans are way ahead setting up specific groups for the TOS platforms), comp.sys.atari.hardware, comp.sys.atari.dtp, comp.sys.atari.graphics, comp.sys.atari.emulators, alt.howimadeanataripage.withmypcandnotHPP and comp.sys.xatarian.needhelp.pullingmyheadout.

You know, a lot of second hand Atari hardware will be surfacing the next few years. People here my want to preserve the interest of those experienced with it incase they run across an SST board, Nemesis, NOVA card, Speed Resolution card, or Afterburner second hand. I don't know about others, but I prefer to use TOS machines, it isn't a necessity for sure, and enjoy sharing information with users that have a common interest. I could give a rats ass about someone who "used to use an Atari, but have a better machine now". We still have several good shops to purchase software and hardware from. They are smart enough to diversify into other areas and still maintain support for the Atari platform.

3829. Help Please: Cab 2.7 and Sting

Newsgroup: comp.sys.atari.st
Date: 1999-12-11 00:00:00 UTC
From: lockwood@nucleus.com
Message-ID: <38523df8cd8730@nucleus.com>
Source record: 68955

After a long time using the Cab 2.7 demo with Sting and Olivier Booklage's OVL, I decided it was time to get the real thing.

Systems for Tomorrow is just tops with me.

Anyway, I know that the full install of Cab 2.7 wants to use ICONNECT, but I wish to continue using Sting.

So the install program will only allow me to designate a folder in the root of a drive, so I did that and then moved it to my D:\INTERNET\ folder. I installed the Booklage OVL and its support files in the MODULES folder, overwriting the OVL that works with ICONNECT, and I removed the SOCKETS.PRG that the installation program placed in my AUTO folder.

I am already using HSMODEM (version 7, I think), under Magic 5.11 (soon to be Magic 6 - same purchase).

When I go online, launch CAB 2.7 and try to access a URL, the first part of the download happens alright, but then I get an alert message in reversed type (white on black) across the top of my screen reading, "Kann Datei C:\ICONFSET.CFG nicht Offen. Press a key.....". When I press a key, I get a dialog box which has the message, "Connection to SErver Failed". When I hit "Cancel" here, the page loads as normal, and the rest of the page's components download without incident. However, should I click on a link, or enter a URL again, the same error messages happen. This is getting tiresome.

Can anyone tell me how to get CAB 2.7 to stop looking for ICONNECT and to just behave with Sting?

Thanks for any and all assistance.

I think the Atari 7800 version of Ballblazer is the all time best. It handled great and there is an extra chip in the cart that supplies the music, and it sounds awesome!

You need to quit looking for demons under your bed. There was nothing smart ass about my comment. It was an honest attempt to help someone looking for Atari hardware.

I honestly didn't know if Best Electronics was still in business. And since the original poster wasn't familiar with SFT, why should I assume that he's familiar with Best?

Well, I found out today why the Falcon power supply did not power everything up. The 12vdc side is only putting out a little over 5vdc.

The 12vdc line on the PC power supply is putting out 11.85vdc and the 5vdc lines 4.72vdc.

>to read the messages I already received. But that is another day.

If you've "connected to host" in NEWSie, then downloaded your various
groups, then "disconnect from host", and then QUIT NEWSie, then, re-run
NEWSie, you can remain on-line/connected to your ISP, and proceed to read
your new messages (that were just downloaded) that are now coming from the
OFFLINE folder on your hard disk. As long as you don't "connect to host"
while doing this, NEWSie ignores the fact that your modem is indeed
connected and on-line.

Another tip, if you've got NEWSie loaded, and CAB loaded, and you are
reading OFFLINE messages in NEWSie, and come to a message with a web
page URL that you'd like to visit, simply hold [LEFT SHIFT] while clicking
the link, and the web page will be loaded into CAB.

Actually, yes. I use POPwatch and NEWSie, often at the same time.

As a side note: I find POPwatch retrieves e-mail _much faster_ than NEWSie
as well. Plus being able to see all the spammers _before_ actually
downloading the e-mail messages is great. And I also generally SEND my
mail with POPwatch (that was created and QUEUED in NEWSie).

And finally, for some unknown reason, with my ISP, NEWSie _will not_
"delete mail from server" despite being set to do just that (another
reason to use POPwatch to retrieve [and delete from the server] my e-mail).

You can do this in Newsie, just use the "Get selected mail" function.

>And finally, for some unknown reason, with my ISP, NEWSie _will not_

If you use the "Get selected mail" function and delete from within that
window it will probably delete it off the server O.K.

Cheers

Can anyone tell me if using Magic PC and pagestream if a printer which
is being used on the pc has to be one that Pagestream has a driver for
or does Pagestream use the Installed windows printer driver. I know
Calamus99 uses the IBM driver so it works with any printer but
I wonder how Pagestream works in this enviorment. My logic tells me
that pagestream will still require to use a printer driver from pagestream and will
not call upon the IBM drivers.
Please if anyone know, please respond.

Gene

I've ripped out the 'guts' of the 286, the only thing in the case now
is the power supply, which I'm going to use to power the Falcon with.

The guy with the multi-meter was gone all day so I didn't get it
today. I was just looking at all those wires on the falcon old power
supply, and was just thinking of how I could hook all of them up.

Newsgroup: comp.sys.atari.st
Date: 1999-12-11 00:00:00 UTC
From: "J.W. Krych" <jwkrych@n2net.net>
Message-ID: <82sdah$9qs$1@athena.netset.com>
Source record: 69023

Hi Fellow Atarians!

Well, it certaintly took a while to do, with many posts here and in comp.sys.atari.st.tech, many cable investments to Redmond Cable, and a few long nights with o-scopes, looking at video signals.

The STf/STe and the Falcon030 now work just GREAT with the VideoTurtle! (Hey Dennis, if you are ever in the Cleveland area, come holler!)

We finally built by ourselves a simple attenuating circuit on a Radio Shack board, the tiny ones with copper on the one side, and correctly setting the jumpers, and vola!

As a side, it is frustrating when you send complete diagrams to a cable company and get numerous promisses that the "next one" will be correct, and they make them ALL the same! :(

I treated myself to a new 26" RCA TV as a Christmas present, and of course it had to have S-Video! :)

The displays in all resolutions, except mono of course, are as to be expected, extremely crisp and clear.

My brother's girlfriend especially enjoyed playing Kid Kong on the 26" S-Video TV!!! And. Llamatron too! And she also said that the display was better than the monitor, RGB. (no spams here please)

But, the real treat was the Falcon030 and the demos, Lostblub, Obnoxious, and Knockout. And, there will be others in due time.

I am not presenting a review here, I am of course slightly biased towards the VideoTurtle, I'm her co-designer!

So, I have two pretty well-known Atari users lined up to give the VideoTurtle and the ST/Falcon030 a pretty thorough review. And some other systems too.

But, much long work has finally come to an end, as yet another system is hooked up with the VideoTurtle.

Spams and debates about the VideoTurtle and the SCART TV's from Europe are not necesarry, the US does not have SCART, plain and simple. And Reviews from other computer systems using the VideoTurtle can be found on the internet. Type in VideoTurtle in a search engine. Bill Near's is a good one. And Amiga Informer Issue 12 has their own review, from Dr. Amiga.

So, you demo fiends out there, what else have ya got to show off? ;)

Regards,

Jim W. Krych

1040STf w/megafile 30, 1040STe w/4MB and 340MB SCSI and Syquest and Ricoh drives, and a Falcon030 with 14MB, a 540MB IDE, a 540MB SCSI, a Ricoh drive, and a 12x CDROM, with VGA and RGB monitors, and tons of CD ROM software.

Thanks to everyone who answered. My mailbox was flooded along with the NG posts. Sometimes I wonder just how damn many ST/Atari users there are on this NG. Many names I have never even seen before replied to me via email.

One thing was certain. Not one bad word about SFT. Not one Negative comment.

So, even though it seemed strange to me they were only open on Saturday, looks like I will be ordering a few things.

Lets hope I am not the first to have a bad experience.

I also believe if we are to get SCSI II adapters, we are going to have to find a store with some old stock, since it appears ICD are no longer trustworthy. What a shame.

Later Brian.

Sorry I am not a programmer. But IIRC when TOS 1.04 came out a number of things didn't work and my friends left Laser C because either it didn't work or parts of it didn't work. If I am wrong, well thats memory for you, but I do remember some problem with Laser C and TOS 1.04 be it a shell or what I am not certain. You can always try TOS 1.02 or 1.00 on ROM.

Speaking of emulation programming. This same friend used PC DITTO on his ST to write Banking Software back in 1988-9. Compiling took more than a few cups of coffee:-). Soon he had Pure C, then called Borland Turbo C for both his ST and his PC.

Later Brian.

Good information to know. I am more interested in the database, so I think
I will give it a go. I use LDW for spreads and would have like to have
changed to an integrated package. I guess I won't be doing this.

>The wordprocessor works fairly well, especially useful for very

When DTP gets beyond rudimentary, I have DTP programs:-).
I am not certain as I have never used it, but I thought that Signum handled
characters such as this? You might want to look into it.

I intend to use the WP and Database, maybe try the spread just to confirm
it is lacking:-).

>

<Snip> actually <RIP TEAR CRUNCH REMOVE MASSIVE IMFORMATION>

I fully agree with Martins Comments. Well done.

Now I might add a less technical perspective as I have recently aquired both.

TT 030 6MEG RAM 4TT/2ST 500hd.
Falcon 14Meg ram 80hd/270 syquest.

Both machines are limited but if you can get the missing pieces either one are going to suit your needs based on the QFUNKS post. Take his comments as a very good way to assess your purchase. If you play games on the Mega, I suggest that you keep it if you get a TT.

IMHO if you have a TT with Graphics Card you have and AWESOME computer. My TT just Flies on the WEB, without a card and it is just lacking in Resolution and colour. If you want to know what a TT is Like with CAB w/o a Card, just put your Mega to LOW RES and load CAB, with a Webpage. The result will be no different on a TT except higher acceptable resolution. There are no tricks I have seen for TT software that do what Photochrome does on the ST to bring pictures to life. My TT I purchased after the Falcon. I have only just connected it to the internet in the past week. I cannot figure out why my FALCON is so slow compared to it, even lowering the Falcon Screen resolution doesn't change the speed. If I had a card for the TT I wouldn't probably use my Falcon. Big Statement eh.

Unfortuneately Apex Media is Falcon Only. THis program alone is reason to own a Falcon.

I like all my Atari computers. I like my Falcon too. My Falcon is in STock Form with 14meg of Ram. I think that if you get a Card, or An Accelerator for the Falcon, You have an AWESOME computer, that plays many ST games, and has many games written for it, ok not MANY, but alot of games:-). It does come with more colour out of the box than the TT and 256 Colours to me is the MINIMUM you need if you want to be on the NET to appreciate its true value. The speed of MY falcon on the internet is the same as my ST if the

ST has a CACHE built up and the Falcon does not, I do not know why the TT is so much faster at Tables. I do not know why my Falcon isn't uncompressing Jpgs faster than my TT. It is not even close. I have JPEG OVERLay and RUN JPGD.prg from the Auto folder. This is my biggest suprise. I truly wonder if my Falcons DSP works. Especially after seeing the TT just whip up some Web Pages, faster than my Falcon did with a Cache built. And it wasn't even close.

It is a tough decision. If you read Erics post closely and know what you want to do, make your decision, if you want an 030 Atari and you are a happy Atari user, neither of these computers will disapoint you.

And the Falcon sound. There is no way to describe it.

If you really can't make your mind up get both:-).

P.S. While I have mentioned cards and accelerater for both machines, Mine are both in STock Form. I am happy to use either one. The TT for speed and the Falcon for colour. The speed of the Falcon is neither overwhelming nor disapointing, It is fully acceptable, particularly if you have been web browsing with an ST, you will like the change.

Just buy one, You can't go wrong.

Later Brian.

>(Hey Dennis, if you are ever in the Cleveland area, come holler!)

That is cool news Jim. Two years ago I purchased the chips to build
an S-VHS output for my machine, but they still sit in the tray.....
Where do you get your clock for the video signal? I am wondering if
some of the Falcons running a faster bus clock will have problems with
the display. Using the Atari RGB monitor requires a video modification
inside if the bus is over clocked, however an (older) multisync is able to
handle the faster clock no problem here.

Thanks,

Mike

Dennis,
Not knowing how much you know about electronics (not that I know a lot):
If you get a zero resistance reading getween the 5v taps it's safe to say
they are'nt isolated and as long as the current rateing on the supply you
intend to use meets or exceeds the Falcon's then I'd tie them together
to the new 5v output. This is only advice which you should get more opinions
on before you go ahead! Anyway, good luck,
John

Can anyone tell me if its possible to get an .ra (real audio) file
into Aniplayer and have it played?
I have Aniplayer installed as a viewer for ra files in CAB, but
when I click on the link, I just get another url and nothing else.
From what I know of ra files you can't download them, so I don't know how you are
supossed to get them into Aniplayer.

I am using STarCall for some years and I like this programme very much.
I've tried the last version (3.0) but with no success. Maybe it depends
on the computer - my stuff is MEGA STE 4 with TOS 2.06.
I went back to the version 2.6 (the best one IMO).

Geneva is a nice AES alternative to MiNT, works rather well
overall. a Tad slow. but not bad at all. The only problem (unless it has
been fixed with latest version) is that it had problem with vt52
emulation, ttp program. Which is quite important in my opinion.

> > P.P.S. - Once I register, Thing and Boxkite will be further proof of
> the advantages of creating demo versions!

Thing is quite easy, fast and cheap to register, Thomas Binder is a very
helpful guy.
Boxkite author I don't know though.

>Definitely.

Depends on your definition of faster. For pure CPU and FPU, TT wins, but for signal processing, Falcon wins. The Falcon also has better potential for acceleration, with the CENTurbo II, then it really thrashes the TT for raw compute performance. Agreed TT has that superb hi-res mode but with CT2 you can have 640*480 in 65,536 colours. So really it depends what you want to do with the machine. The TT is really quite a beautiful machine to look at, though.

>The TT030 also has room for an internal 3.5" SCSI hard drive

A CT2 Falcon also has accelerated IDE bus and with a 3.5" drive can certainly compete well with 3.5" SCSI.

You can use Toswin 2.5 with Geneva 006. I've tried it, it works :-) You
have to run MiNT as well though.

I have been messing around with Seurat, which will use PageStream
fonts. Seurat is a commercial paint program. Might be a reasonable
alternative to the workaround you are currently using.

This is a predecessor of the Spectre, and is in fact a Mac emulator.
You will need the software to make it work, and a manual will also
be necessary. I don't have these, but somebody certainly does. And,
as I see it, having the hardware entitles you to the software. IMO.

There is another thread that includes the thought that small,
one-man-band operations are more vulnerable to personal problems.
This is what happened to David Small of Data Pacific and Gadgets by
Small, just about the time that I sent him a check for the software
for my Spectre. I never received the software, but the check was
never cashed. This proves that shagging customers and exiting the
back door doesn't have to be done. Thanks, Dave, for your honesty!

Ok, I have ran into this with NEWsie as well. I have also heard of others having run into NEWsie downloading mail slowly. I do not have this problem at all, it works very quickly for me. I have ran into a problem where a message file I receive, perhaps a binary, is actually placed on a remote host. What happens is that I will get my normal mail and then another mail stored somewhere else. I go to delete and sure enough I can't delete the large binary stored elsewhere. The message EOF remote host appears. I ended up getting the ISP to delete the mail. I do not use popwatch, but I may test with this to see if this will delete such mail.

Yes, this should work. However as I have posted earlier, I did run into a glitch. I am not certain if this is similar to Pauls or Not. However NEWsie should be able to Delete Mail after being read without the need for popwatch and without the need to use the GSM function.

swampfax@earthlink.net (John Garone) asks:

S > What's needed to dump the contents of a Megafile30 on an ST4
S > to a Seagate on a Falcon?

If you have access to a portable SCSI drive (hard drive, zip,
whatever) and a TT, not much. The TT has both ACSI and SCSI ports
and is very forgiving about what you hang off of them - two
strengths that I think Martin-Eric missed on his list. Makes the TT
a very versatile machine - every Atari community should have one,
just for jobs like the above. I end up doing quite a bit of it, and
will end up doing more when I get a CD writer (RSN :-)

M > don't have the URL

ST Informer distributed Mega-Chek, and maybe still does. I have
owned it for years and was never able to come to grips with it. I
currently use Phasar, which appears to be Y2K compliant (ask me in a
few weeks!).

Of the _many_ freeware/shareware checkbook programs that I have
tried/used, the one that looked most competent was by Aric Friesen.
Can't remember the name, but is very plain and will run on the TT.
Email me for more info or to send the file.

Or you could do what I have done for the most part - just set up a
spreadsheet. Not very difficult, and works reasonably well.

:-)) 'Nuff said! Most of the juice from the 12v line is used to spin the
discs.

> The 12vdc line on the PC power supply is putting out 11.85vdc and the
> 5vdc lines 4.72vdc.

These are close enough to what you want. There will be a small regulator
adjustment pot. somewhere which you could tweak to get the 5v spot-on if you
are VERY meticulous.

I've been thinking quite a bit about how much fun Space Empire Elite
was back in the days when local BBSs was the online form of
entertainment and the internet was that thing you accessed at school
on a VT-100 terminal to do research.

Space Empire Elite was such a cool BBS game especially the networked
version that would pit your BBS against other Atari BBSs all over
the world.

I've really missed playing SEE and a thought just struck me...
Would it be possible to play SEE through E-mail? Never having been
a sysop I don't know what sort of files SEE generated to handle all
the in going and out going communications but if they could be attached
to E-mail then would it not be possible to play SEE with people all over
the world through E-mail? Or perhaps the original SEE itself could be
modified to make it more E-mail friendly.

I guess on the downside, since we'd be running it on our home computers
instead of a BBS, we'd have to be every player in our empire. It
could get pretty complicated organizing the efforts of that many players
yourself. Although I suppose it would make it seem more like you're
an Emperor handing down orders to your admirals.

I don't even know if there are any old SEE fans here, but if there are
some with a more technical knowledge of how SEE worked I'd be interested
in hearing your thoughts on launching a SEE game through E-mail.
I've got a hankering for some intergalactic conquest.

Incidently, is SEE available online anywhere?

Actually.... maybe there's an Atari ST programmer out there seeking
inspiration who would like to make an updated, graphical version of
SEE that generates files that can be e-mailed for global competition.
This would be cool too because then the game could be geared towards
single player galaxies as opposed to multi-player galaxies in the
BBS version. It could incorporate some sort of treaty system for
making alliances with other players to create that 'group-effort'
feel the BBS version had.

All this time the trouble has NOT been the power supply in the F030, but the Cable to the IDE drive! yep just by chance I moved the drive while using the multi-meter and the flickering power light came on steady. There's something wrong in the ide drive cable, is ok if I keep it un-twisted, BUT! what ever went, blew the video, I took the monitor off my 1040ST (monitor works fine) and put it on the F030 with that plug, ...

Nothing, nadda, doesn't even light up the screen,
with OR without the ide drive. So, the F030 will be put away until I can afford to have it looked at many months down the road.

Bummer.

I'm sure Danny will respond to the postings here in due course. But I
understand that he is in the middle of moving homes right now, so
there's bound to be a bit of delay in getting things done.

That's not to say that he shouldn't be keeping everyone informed about
what's happening with their shareware orders. But I do know he is up
to his eyeballs in things and many things are not being attended to as
quick as they should, but I am sure he will get around to doing what
he MUST do as soon as he can.

It's a shame but when you're trying to make enough to survive on you
do tend to let the activities that don't bring you money slip behind.
Unless you've been involved in shareware support I don't think many
people realise how complicated and time sapping it is.

Best wishes
Mike Kerslake

I'm not certain. I think I might still have a copy of the source somewhere around here. If someone else has it that would be great as I'm not certain which one of the 100's of floppies I have that it might be on.

I think it was available on Genie. Maybe it still is.

Well I think the way you would want to do it is with some sort of server. Even if this server was nothing more than someone that could dedicate an email account to the idea. This way all players would send their 'movements' to the server and at some set time the server would run all the moves and email out the updates.

This wouldn't necessarily have to be an email client either. You could do a real server that ran somewhere on the internet. Users would connect with a client and upload their movements. And then the next day reconnect and grab the new universe status. This would require someone with some server space and time that they would be willing to donate.

Either way it sounds like a great idea. I know that there have been some linux open source projects along these lines, but the ones I can remember run in Java :<

I would recommend doing a litle bit of searching out there and see if anyone has tried what you are discussing on the PC or linux. If they have and the source is available, this would be an easy way for us Atari users to grab someone elses server time. ;)

Either way I would definately think this project should be specced
out completely and the project made open source. If it's interesting and
no one has done it before getting a linux version started by someone
becomes easier and then we have alot more potential players.

Please allow me to correct your misconceptions.

CyberSTrider shareware support is *NOT* the same entity as
Cyberstrider Limited. The latter is an Internet services company. The
former is my own sole trade trading name. Both have separate accounts
and pay separate taxes and are different companies, only linked by me
being the common factor.

Cyberstrider Internet came about because of the ever increasing
activities within the sole trade business. I looked at the situation
and decided to separate it from the sole trading side and make it
prosper as a Ltd company. The shareware side is being phased out, and
the .org name will then totally migrate over to the Ltd business.

The sole trading company does not make enough money (hey, did I
mention the huge loss it makes?) to afford web design/web site
maintenace from the Ltd company - and true - the Ltd company will
charge 'Denesh Bhabuta Trading As CyberSTrider' for any such thing. As
such, the shareware site is updated as and when I personally find some
time.

So once again, please do not mistake the shareware side to be part of
the Ltd company.

>an afterthought the Cyberstrider site is the only site I have ever

Please tell me where this guideline is listed - our accountant
informed us to list our company details (VAT Number and Company Reg
Number) on official company documentation (even on non-invoice
documentaion). We have also been advised by internet savvy lawyers to
list these details on our web site - which is also classed as official
company documentation.

>material,also try to view the source of the site "nosey git" what a
>bad advert for a prospective corperate buyer,it strikes me that they

Not really - it is a tongue in cheek comment - plus which corporate
buyers are interested in how the code is written? Maybe the engineers
and IT staff who wor for these corporae companies - but not the people
that matter.

>have too many irons in too many fires

Which irons and in which fires? Please tell us all. I'm intrigued as
to how you seem to know much more about our company than we do. ;)

As in one of the other threads about why we were closing down our
shareware service in its current form, I am still keen on continuing
taking payments and have a kagi like system. Some of my current
authors are keen on this idea.

We have the system in place - people can pay by credit card online.
What we will no longer be doing is processing the registrations - we
will do the payment processing for the authors who can not take credit
cards - the orders will be passed through to them for processing.

Either that, or we give authors the ability to ake CC orders on line
themselves (we provide bureau services where people do not need a
merchant account).

What do people think?

With mac I know you have to format a disc under the dos utility and then
copy the files that way... how do I deal with the format differences
with a pc? can I format a disc on the pc and use that to copy my atari
files? if so, do I need to stick with a particular type of floppy and
formatting?

3892. What's It Worth

Source record: 68968

Hi MP3 fans !

Yesterday, two great software were released :

* Aniplayer 2.08 (http://perso.wanadoo.fr/didierm/)
For accelerated Falcons, TT and clones.
It perfectly works under TOS, MultiTOS, MagiC, etc.

* FalcAmp http://falcamp.atari.org
This one can plays MP3 files on STANDARD Falcons !
Boosted Falcons (Centurbo 1/2, Afterburner, Nemesis)
can even play MP3 with a multitasking environment.
But it's a beta version (.TTP file).

Have fuuuuuun ! :)

You could hack into the MAGIC.ROM file with a file editor like KNIFE. I've done this and it worked. Find the sequence QWERT and edit the keymaps to your liking. Do make a copy of the original file in case you screw up...

but why should you if you have paid your money ? , for a company who
profess to construct and maintain web pages,offer all manner of
internet services,venture capital,and God knows what the Atari
section of the site has been in dissarray for months just because you
want some Atari software you should be treated no different than any
other customer get in touch with the trading standards office who will
swiftly take up your case they have just given PC world a good
trouncing on my behalf

an afterthought the Cyberstrider site is the only site I have ever
seen with their "vat number" on ,this was also on their flyers for the
recient show,I have had a vat number since it was invented and as
anyone in business will tell you it should only be printed on
invoices,the proper method is to quote "vat registered" on non invoice
material,also try to view the source of the site "nosey git" what a
bad advert for a prospective corperate buyer,it strikes me that they
have too many irons in too many fires

You forgot one category - the ones that thinks that a
030/graphics-card/ethernet upgrade is a neat hack. I'm one of those, and I
will most likely buy one of Mario's kits for my Mega. Most of those that
still use Ataris belong to that category.

Make sure you're not clicking on a streaming audio link. That won't
work. But, pulling an entire *.ra file should work. I've tried it,
and it seems to.

Come to think of it, your right, the Graphics on the 7800 were EXCELLENT
compared to the computer line, I KNEW it was one of them, and for some
reason had it stuck in my mind the 7800 had the nasty blocks, but,
after a load up of the game(Yep, got it to work) big blocky tripod
things..lol. but , none the less, the game is fun, either machine.
Still can't remember how the sound was on the 7800, but I still love it
on the 800.

Computer Direct was Chris. It was a little whole in the wall in Edmonton. He made it seem from his adverts that it was a big computer store but I have seen bigger bathrooms. He had a recording 'none of our sales representatives can talk to you now'. I do not think anybody else could fit into the whole in the wall.

BTW what happened to Toad?

Well to be fair my cheque's still not been cashed so I will just
cancel it. All very sad especially as any dealings I have had with
Denesh have always been good and I can also understand that he really only
does(did) the shareware thing as a service to the Atari community but
I won't waste any more of time emailing him over it. The problem is
some of the Author's email addresses are no longer current so it's a
problem trying to trace them.

All the best

I am looking to trade a Hewlet packard 320LX Palmtop for a Video Game system. The HP had 4-meg Ram, Windows CE (95) with Microsoft Word, Excel, etc. Still have box & Instructions and looks/workd like new.

The systems I am most interested in are TurboDuo, Atari Lynx, Gameboy COLOR or Atari 7800 with games.. Will also listen to other offers but already have Playstation, Genesis, SNES, 32X, and super gameboy for SNES. E-mail me direct at tonym04@aol.com since I don't often drop by the newsgroups.

NO JUNK PLEASE !!!!

We REALLY need some people to take up the Shareware Registry
business, especially for International orders now that the previous
ones are all going away. We in the US have no way of registering
shareware without doing overseas transactions. I get kinda freaked
when sending my money long distances, which prevents me from getting
full versions of the software I need. Anyone willing to give it a try?

That would be Keith Skroggins (or however his name is spelled).

3918. millenium tips ?

Newsgroup: comp.sys.atari.st
Date: 1999-12-12 00:00:00 UTC
From: paul.williamson@zetnet.co.uk
Message-ID: <3853bf3c$0$18512@news.zetnet.co.uk>
Source record: 68990

Hi all,

Just a thought, but how about everyone who can, posting a good hint or tip on the way to get the best out of their favourite software. There must be loads of us using programmes on a daily basis who miss out on really useful features just because we haven't found them yet.

The recent reminder that if you are reading offline messages in Newsie with CAB running and then hold down L/Shift while clicking on a URL it opens the page in CAB is the sort of thing I mean. (Thanks to Paul Nurminen for that.)

The other one I use a lot is to hold down "shift" while clicking on a link in CAB and that opens a new browser window. I can't remember if I read that in this group or the U.K. zetnet list, but thanks to whoever posted it.

My tip is for anyone who uses Cubase midi. (Although it may apply to other versions.) If you are using an editor, and want to see the same note quickly in one of the other editors, select it, hold down alt while using cntrl + R,G or E (depending which editor you need) and this will open the editor with the required note selected. Tiling editors or windows then enables you to follow the song in more than one window. (Better on more powerful machines).

Any more ideas ? This way we can enjoy our millenium tips and leave others to worry about millenium bugs :-))

Cheers

Paul

3919. Converting clipart to Atari

Newsgroup: comp.sys.atari.st
Date: 1999-12-12 00:00:00 UTC
From: Alyre Chiasson <epinoche@nbnet.nb.ca>
Message-ID: <3853C185.513F78C4@nbnet.nb.ca>
Source record: 68991

Hi,

I would like to use my collection of PC clipart on my Atari. Is there anything on the PC platform that will do batch conversion of WMF (Windows metafile format) to GEM or even IMG. I am not aware of any Atari program that reads WMF format. Photoshop does do conversion to IMG but it retains some form of color definition which GEMVIEW doesn't like. I could use Photoshop to go to BMP or similar then use the conversion mode of GEMVIEW to get into a suitable IMG format (2 colors), although possible it's somewhat elaborate especially dealing with several 100 MEGs.

Anything more direct?

Thanks

Alyre

>to just behave with Sting?

In "Options/General" do you have the "connect autmatically" box ticked? If so, clear it. This is for IConnect users, and allows CAB to automatically call the dialer and create a connection to your ISP.

If not then I'm not sure what's wrong, it should work right out of the box.

I hope this is true with Everyone Dave did business with. I met Dave
Small at a number of shows and though I never bought any of his products, I
just thought that this guy was super entertaining. I used to read his posts
where ever I could. When I returned to my ST, a few years ago, I was hoping
to still be reading his comments and opinions. However, as life continues,
it would appear that Dave to has Moved On.

There are a number of Early Atari Developers that I have a great deal
of admiration for and I would personally hate to hear that Dave Small would
resort to unsavory tactics during bad times. He just had to much class.

If only other good Atari Supporters could have been more honest as
times became to difficult, but this is rarely the case for many developers
and dealers when faced with dire economic circumstances. All Scruples are
soon discarded.

Later Brian.

Don' worry you did below.

>If you've "connected to host" in NEWSie, then downloaded your various
>groups, then "disconnect from host", and then QUIT NEWSie, then, re-run
>NEWSie, you can remain on-line/connected to your ISP, and proceed to read
>your new messages (that were just downloaded) that are now coming from the
>OFFLINE folder on your hard disk. As long as you don't "connect to host"
>while doing this, NEWSie ignores the fact that your modem is indeed
>connected and on-line.

Yes, and this a clumsy procedure. I have done this and was trying to avoid
the step. The previous post, disconnecting and reloading a NEW GROUP file,
and bring up the current grp file from the file selector works just as well
and removes the need to exit NEWsie. However I have had, with every machine
I own a problem with reading NEWsie files that are offline when STing is
loaded. I am constantly losing messages. Such as I do as you suggest here
is a sample of what can/ not always/ happen.

80 Messages in Offline NG.
Download 22 NEW Messages.
Now 0 messages appear.
Exit NEWsie as you would suggest.
Reload NEWsie and See that there are 102 Messages.

Open the Window and start reading some of these threads, While still
online. As I exit the Window, and I haven't deleted any files, I may see
only 70Messages left.
I open the window and sure enough 32 Messages go missing.
Read some of the remaining 70 messages and close window, and all of a
sudden I have only 39 Messages. Eventually I will have ZERO.
These files are still in the offline reader, but the XOVER.TXT file has
lost the cache data. So what I have been doing is only reading offline
files while STing is not loaded and I have never, ever lost a file.

And Should I have exited NEWsie and reloaded either online or offline the
missing files will not appear in the window ever again.

>Another tip, if you've got NEWSie loaded, and CAB loaded, and you are
>reading OFFLINE messages in NEWSie, and come to a message with a web
>page URL that you'd like to visit, simply hold [LEFT SHIFT] while clicking
>the link, and the web page will be loaded into CAB.

Yes, this was the reason I was asking in the thread, I wanted to do this.
So it is good to see how you and others went at this task. I will use this
in emergency purposes, but really I hate having files disapear on me.

Thanks for your help.

Brian.

Hey, I don't know about any others around here, but I think I would be willing to pay a few bucks extra on registering shareware to help make it more profitable for you (or if nothing else keep it from losing money for you)! As soon as I can get myself an SSL connection, I will be registering iPRN II through you (assuming you are still doing the registration then), and I wouldn't be offended if you added a few dollars to me fee! Anything if it will help you out! Any others feel the same way? I think it's completely worth it in order to keep shareware registration services going, especially ones that do E-mail/Credit Card orders so we in the US (and other countries) can register without the hassle of International transactions.

Macs have been able to read DOS disks for years. Just make sure that you have the PC Exchange extension loaded and it will recognize the floppy.

I used to have an Atari version of Cubase and upgraded to Mac about 4 years ago. I just read the floppies into the Mac Cubase. It didn't have a problem. Then I saved them on the Mac hard drive.

However, I did have a problem if I formated the floppy on the Mac and then had the Atari try to read it. Only Atari-formated disks could be read. For one thing, my Atari would only read the 720K format (standard density), not the 1.44 drives (high-density).

Hi Denish,

I am one of the 'nosey gits' who looked at your HTML coding. Not to steal, but with a view to seeing how an expert, in this case 'Tony Greenward, does it. It's a very simple matter to find the code, but I won't tell. Suffice to say that IMHO (and I'm learning HTML with a view to my own Web page) it's not only a very good example of basic code, but more important, Tony has set it out in an ultra-structured manner, with a plethora of explanatory remarks. Nice coding Tony.

Bob King.

ps. I am trying to register AniPlayer and have e-mailed the author direct, if you are now able to take the dosh in this country, then let me know.

Hello world,

A while ago I complained about the fact that some ASH programs, like for
instance the famous ASH-mailer, are only usable under MagiC.
Today I received a very interesting mail.

==quote==

The only thing you have to do to let ASH emailer running under Mint is to
take an hex editor search for the appearance of "MagX" and replace it with
"MiNT" (two times).
Voila, here you have an emailer that works under N.AES too.

==unquote==

Try this address: gryf@hrzpub.tu-darmstadt.de. You'll see it's slightly
different. Anyway Thomas is still there. I've been in touch with him a few
days ago.

Hmm... FalcAmp works OK but Aniplay repeats every bar like an echo. An
body else have this problem?

Hi,

yup same here: since I hardly use the TT to access the Internet, it's
Free Agent for me, running Win. If ever using the TT, it will be
Okami.
Perhaps once in a while running Linux on the Intelbox, then it's
Knews.
My OLE was dumped into the can some time ago :-)

Now we're at it, merry Xmas to everyone!

What you need to do is format on the Atari with the traditional format
(2 sides, 9 sectors, 79 tracks). This is always the standard format on a
PC.
Although the Atari only does DD Disks the PC will still read it because it
is a staple format.
Cheers,
Lee.

I assume you need N.AES 2.0 for this? ASH Emailer use AES-objects in it's
userdefs AFAIK, and N.AES < 2.0 is not reentrant the same way as MagiC.
The same applies to Chatter btw., it would be interesting if anybody could
try Nightowl's hack on this one as well.

Indeed :-) I've been using it all night, playing all sorts of MP3s I could lay my hands on. It works really well on my Falcon/Afterburner, even when playing 128k mp3's I have just enough spare cycles to use a text-editor. Resampling seems to use a bit CPU-time and degrade the sound a bit, so I'm going to get a 44.1KHz clock somewhere and try it. Does anynbody know about any DIY-projects for this?

I agree fully here. One time I requested benchmarks on a Hades and was
told certain GEMbench values and how many times faster the same Calamus
doc formated on some pc vs a hades. I've seen gembench in real life
at a show give bizarre results on a hades and even negative values! And
this was a dealer giving me such info. Real world times would make much
more sense to buyers.

And Group 3: People who got an ST, coming out of an 8-bit or TI (9900 is a 16-bit machine, too - the first one) (or not "coming out of it", as my TI will die when I do) and think it's neat, become fanatical about it, want to do everything with it just to show you can. I suspect there's more than a few of these around - I'll bet Mario himself is one - and those are the people who will buy them. Is it a profitable market? nope. Is it fun? yowza!

Same here. TT repeats even more, but I don't think a stock TT is cut out
to play mp3 at full speed. Falcon does a few less repeats I assume cause
the DSP is involved.

They quite the Atari market and another guy purchased what remained of there inventory and was selling it thru a webpage and on ebay.
Sad state the Atari dealer market went into when it seems there's still a number of us whom like to continue to use our Atari's and would still be willing to continue to purchase new items for them.
True the Atari market is smaller than it use to be since they are not made anymore and only a small number of TOS clones exist to add anything to the already small market. But for solid programs I think their's still a good market for them.

Error #-36 means a file is set to read-only status, but of course you already know that.

Have you checked the integrity of your Mac's file system? Perhaps Norton Utilities, TechTool, or Disk First Aid will find something inherently wrong. Also, poke around with Selectric to see if any hidden files could be causing the problems.

> English.
> You can find it at http://www.milan-computer.de/gb/products/milanII01.html

Interesting benchmarks...but I should hope that the integer and floatmath performance figures will actually be dramatically better than that! I do have trouble believing that a 66MHz 060 is only 8.5 times faster at integer math and 9.2 times faster at float math, than a 16MHz 030/882 combo!! Else I would NOT buy the MilanII!! ;(

Can you provide more 'real-life' benchmarks? Like how long 'skyvase.pov' takes to render?, how quick a large JPEG can decode?, how fast can a 320x200 Quicktime movie play?, how much CPU time is needed for realtime MP3 decoding?, how quickly can GEM-view now load/dither large images?, how fast can Lattice C/PureC compile POV-ray3 source? etc...

Those Atari users seeking the ultimate in power (an 060!) would more likely be interested in those benchmarks than GEMbench (a contentious benchmark program IMHO!)

Kind regards,

Chris Wilkinson Christchurch, New Zealand.

Wooo Bundy! Look at the fast ram access!

When Chris at Comp.Direct posted benches from the T060's, he stated
that Gembench didn't repeat well (yea, I know he lied about a lot of
things, but Gembench figures and the 060 haven't jived since the
release of the Medusa).
The benchmark app that comes with the Nemesis would be interesting to
see run on that machine.

Interesting how trn didn't show up in the list. Unless that was
the unknowns. Iknow that I have posted a few via trn.

Denesh - the main problem here in North America is payment. I, for one, do not like sending cash through the postal system. My concern is the US Postal System, not those of European countries. Getting cashier checks or payment vouchers here in foreign currency is a PITA as most US banks tack on a hefty surcharge. If you come up with a way that allows payment to the authors automatically via credit cards, that sounds like the way to go.

If your Atari and PC are both online then simply attach the files to an
e-mail and mail yourself, pick up the mail on the PC and files with it.

Alternativley if their side by side connect them together using a null modem
cable and run Ghostlink.

Or use a DOS formatted disk, I have found that if you use this method a TT
or Falcon with a 1.44MB disk gives the best results, you could use a 720K
floppy but formatting it using a PC running Win 95, NT or 98 always resulted
in my TOS 1.2 STfm displaying the alert box stating the the data on the disk
is damaged so I would suggest formatting it on the Atari if possible, IIRC
DOS format for a 720K floppy is 80 tracks 10 Sectors as opposed to the
Atari's 80 tracks 9 sectors.

>
>Wooo Bundy! Look at the fast ram access!

Please note that any benchmarks that may have been taken by now were done on
a preliminary development board, which is running the 060 at half bus speed
and does not have the final RAM timing, so you may expect differences on the
final model.

>When Chris at Comp.Direct posted benches from the T060's, he stated

I get quite repeatable Gembench results on the Milan (040 and 060). However,
to test the memory subsystem, I recommend memspeed by Torsten Lang, which
gives comparable (and reasonable) results on any machine.

>The benchmark app that comes with the Nemesis would be interesting to
>see run on that machine.

If you give me an URL, I can try it. However, I do not like to publish
benchmarks from a machine that is not yet finished.

Niall Moran wrote:

> Is the TT substantially faster than the falcon?

Yes, it is. And it doesn't have the well-known SCSI/DMA problems most
Falcons have. I have both a Falcon and a TT at home and in my opinion
the TT is definitely more professional. If you want to do things like
hard disk recording, for example, the Falcon is more appropriate.

Well, I've been all over Bengy's Magic page and have found the link, but there is no file there.

My new installation of Magic 6 has messed up my keyboard assignments. Does anyone have the program that re-assigns the key mapping for Magic? Or does anyone have a KEYTABLS.SYS file for a North American keyboard layout?

Thankyou for your indulgence while I configure my new software. Next week: NVDI 5 - that should go smoothly....

I will email you this file. The reason it is down is because Atari.org,
where my complete download bay was hosted , is not yet, and will not in the
very near future be hosting pages again. Im sorry for this, I know that some
of the files in the bay are very useful and hard to find other places.

Now, ive had offers to host the bay, but they are all very kind, but I would
like a STATIC place. Most offers say "for awhile.."
Anyone know of any fast place that will offer 50 megs free, with no
advertising? (I hate advertisements on MagiC Online, thats why I removed the
banners..)

>ST anymore; they would rather buy a CD-writer for their PC.

Doesn't sound like you are talking about ST users as much as you are talking about PC users. Your above statement has so many leaks it could fill the Baltic Sea.

IF a user owned a TT/Falcon and a PC/Mac. I am certain they would buy a CD-writer for the PC than for a TT. People mainly bought TTs for CAD and DTP, not the internet. Why buy a ram expansion and graphic card or Ethernet card for the TT when you can buy a WHOLE NEW PC for the same money. I would say most MUSICIANs bougth an ST because they needed a cheap midi sequencer, although when you priced out Notator, I think it was not cheap, only superior. Other users bought an ST because they wanted a good computer with a GUI and nothing with regard to music. Often the midi ports where a mystery to many ST owners.

I don't believe for one minute that I am the only ST user using an ST on the internet. I don't believe that TT users and Falcon users are a majority. I know this because I receive many emails, and I mean MANY emails from ST users that discuss using their STs on the internet, and I speak with many more who want to know if it can be done and what are the minimum requirement.

Not everyone wants to throwaway money on a New PC. While TT and Falcon users are more prominent in this NG, I would say this is generally because they are the power users and are usually more knowledgeable in many subjects that come up. But don't discount the lurkers who read and gather knowledge using the STs. Of course not all ST users are lurkers or non technical, some guy was very involved in a TCP-IP stack that he developed and used on his 12mhz modified ST.

It is however only a matter of time before an ST user who is on the internet wants more power. If this power can be found in upgrading their ST they may follow that route if it is available and practicle.

If one is using an TT or Falcon and they see a hardware mod for their ST or STacy, and it is affordable practical and beneficial, there is another potential buyer.

The other routes an ST user will take is to purchase a 030 machine or leave entirely and get a PC depending on their wants and needs. And yes a Mac too. However as some Frenchman hiding in Finland said earlier this month, the internet is not everything. And generally if someone is still using an ST while owning a PC/Mac for the internet (and there are many here in this NG), then clearly there is some reason why. And if they are using a program on their ST and would like more power and colour for it then all the more power to them.

>Those who really use only Atari for _everything_ use a TT, Falcon
>or a clone (Medusa, Hades, Milan), nowadays.

Bah Humbug;-). I guess those users using a ST for the Internet, DTP, CAD, Music, programming, WP,Database,Family Tree, Spreadsheets, and Everything the ST is capable of Don't exist and our a figure of my imagination.

I guess their should be no reason for MP_STe. Nah, no need to view those south park videos and motorcycle racing on my ST. No need for hardware developments like Video Turtle. I can tell you this, I would have killed for SVHS out of an ST 7 years ago.

>IMHO, the market is divided in two extremes, nowadays:

>1) People who keep their old ST for games or MIDI, because their
>ST cannot do Javascript

Nor can my TT/Falcon, capable, but doesn't exist.

>nor Ethernet

Nor can my Falcon, Or my TT until you sell me your Reibel card:-).

> so Atari is really dead.

Well, it is YHO. But I think you mean Atari ST is really dead:-). But so what if the ethernet adapter is made I will buy them for my STs and my Falcon. Heck even for my TT. Won't I have a fun/fast intranet.

>They have seen the light and are happy to report that Atari is
>"outdated, slow technology" just because their ST didn't cut it,

Cheap bastards.

>Group two is willing to pay, as long as they get exactly what
>they want to get their TT/Falcon to perform what they need.

I believe this to be true.

>Mario (or yourself) may think differently, of course. ;-)

God Bless.

>Anyhow, this was just my two markka.

What could you buy with two markka? More than what I could with 2 cents?
Pack of matches, maybe some candy/gum? Reibel Card? I do have a few pennies
to spare.

Later Brian.

>Here's a slightly larger sample with a version breakdown and a summary
>with a total of 365 user posts between 1999/11/11 to 1999/12/11.

<Snip>

Nice Sample. I knew someone would do a more accurate assement. Very Good.
I did however eliminate posts that were from the same user. Such as if in
one day, I used NEWsie 12 times to post a message, this would beconsidered
one NEWsie User. If I used, NEWsie and MSOE at work, then this would be
considered One NEWsie user and one MSOE user. I guess it doesn't make sense
how its done, just stats. SO at least this does show what happened as well
as the activity.

I don't know why but I was always curious.

I am sure you slept well after scanning the information:-).

Later Brian.

Hi Brian!

> Doesn't sound like you are talking about ST users as much as
> you are talking about PC users.

Group number one below: those that bought an ST for sequencing,
out of a pawn shop. Those are the ones thinking that, since an
ST is only 8 MHz slow, 4 MB low on memory and cannot drive their
modem at 56k, therefore the whole Atari platform is dead... but
it's still a cheap and effficient MIDI sequencing kit enough.

> I don't believe for one minute that I am the only ST user
> using an ST on the internet.
> It is however only a matter of time before an ST user who is
> on the internet wants more power.

And, depending on wether they are die-hard Atari fans or mere
users, it will either be a TT/Falcon or, more likely, a PC.

> > so Atari is really dead.
>
> Well, it is YHO.

Not MHO but the "my ST cannot do <something in particular>, there
fore the whole Atari platform is dead" logic of people who go PC.

> >Group one thinks it might be fun to upgrade from a floppy system
> >running TOS 1.xx to finally experience TOS 2.06 and hard-disk.
>
> I agree.

But that's as far as they're willing to spend on their "outdated"
ST; only just enough to make it more convenient to sequence, so
it becomes self-contained with a hard-disk, no more.

> >Group one really doesn't want to pay for anything, because they
> >got their ST for peanuts, in a pawn shop or at an auction.
>
> Cheap bastards.

No, it's the pawn shop reality. If you got your whole MIDI rig
out of old MIDI gear plus an ST with Notator for peanuts, you
definitely won't puchase an expansive accelerator card for it,
knowing that you can get your hands on an early Pentium for less.

> >Anyhow, this was just my two markka.
>
> What could you buy with two markka? More than what I could

> with 2 cents?

2 markka = 0.50 CAD

You're not only describing ex Atari dealers. The whole retail industry in North America is based on pure greed. I have _never_ found _any_ store where I got good service nor workmanship while I was living in Canada. I'm not just talking about computer, but also music stores, hobby suppliers, Internet providers, landlords ... you name it, where there's a buck to be made, there's someone to be shagged. Honesty, in general, is a human quality that tends to disappear on this planet, in North America especialy.

>Thanks Steve - that was pretty low. :(

As someone who _was_ waiting for my order to be processed (and I will
repeat this for the people who missed my last posting) - is that Denesh has
emailed out my order, explained the reasons behind it, apologized for the
delay etc. I don't think that he can do any more than that to be honest...
and I'm happy with his response.
Please let's try not to alienate the one bloke left who is still helping
us get this shareware software registered - a bloody nightmare at
times and at other seemingly impossible! As Mike Freeman said maybe
it would be more constructive to see if we can think of further ways
of helping the guy, to make it easier for him to continue and possibly
then add a lot more authors/ software under the CyberSTrider wing
without all the current hassle involved.
I am stuck atm for a SSL Ovl with my MagiC / CAB System - although reading
a few other articles here lately this might change :-) so the 'online'
credit card scheme wouldn't work for me yet.

Regards
Sean

ps. How is Joe Connor these days? - haven't seen any postings from him
for a while - InterActive, much missed in this household.

Unless international credit card orders in German are your forte, it
will take an English speaking distributor. I talked to ChroMagic the
other day about it and he said that he wasn't getting a response to his
emails. Not a positive indication.

It was one of the unknowns, as most of the Pine users would have been if
it hadn't been for the fact that Pine seems to start the message IDs
with '<Pine.' A lot of the newsreaders don't use the X-Newsreader:
header so it was a case of looking for an equivalent to it, i.e.
X-Mailer: User-Agent: and the few others that show what was used.

<madmax@bfree.on.ca> writes

>Nice Sample. I knew someone would do a more accurate assement. Very Good.
>I did however eliminate posts that were from the same user.

That's what I did as well. It took the ~1860 posts down to the 365
poster/version combination.

> Such as if in
>one day, I used NEWsie 12 times to post a message, this would beconsidered
>one NEWsie User.

I took it a bit further. If someone posted only using NEWsie, no matter
how many times, that's one NEWsie user. The only area where there could
be an improvement is where the NEWsie user uses two or three different
versions of NEWsie. In this situation the user becomes duplicated[1].

> If I used, NEWsie and MSOE at work, then this would be
>considered One NEWsie user and one MSOE user.

That's how I worked as well. The summary probably needs another working
out as there were a few people who posted using different versions of
the same software and ended up being counted as a separate user. Then
again, after spending the time on it, I don't fancy going through it
again to get it any more accurate.[2]

> I guess it doesn't make sense
>how its done, just stats. SO at least this does show what happened as well
>as the activity.

In the end it's only numbers. Now I'm waiting for the "Gosh, aren't
there a lot of people still using Atari's" comments. :)

>I don't know why but I was always curious.

That's why I ended up doing it.

>I am sure you slept well after scanning the information:-).

After I'd stopped thinking about how I could improve the prog-lets I
used to extract the data, I did. Must remember not to do this sort of
thing just before going to bed. :|

[1] This probably skews the values a little as all the versions of
Outlook Express were counted together.

[2] I hated statistics at school and don't fancy going through it all
over again.

I don't use Pagestream but I do use MagiC-PC: it doesn't use the Windows system printer, so you will need a printer that you can drive with Pagestream.

IIRC MagiCMac has some way of using the Mac system printer, but this may be only for programs that output using GDOS/NVDI. This isn't an option with MagiC-PC 1.2 and NVDI-PC. Not sure if NVDI5 has altered this situation.

Thanks Steve - that was pretty low. :(

I repeat - Cyberstrider Ltd is not an interest - it is a fully fledged business with a proper business plan and with a full product line and support to go with it. There are also shareholders in the Ltd company - so it isn't only reliant on me.

The shareware scheme is a 'sole trade' business - more an interest than a business - but classed as a business for tax purposes. This was solely reliant on me being around.

Thanks guys - I wonder now why I ever bothered over those number of years with the Aari side of things if these are the snide comments I now get. :(

A GEM version of Doom was shown on the Milan II - was this your version?

When do you expect a release of the VCS and GameBoy emulator? It would
also be great to see M.E.S.S. (http://mess.emuverse.com) on Atari/clone
systems because it emulates about 20 different computers/consoles.
M.E.S.S. is based on M.A.M.E. and even emulates the Amiga.

Anyway, keep up your good work! Your ports are appreciated!

Greetings,
Matt.

Hi!

In article <1e2rkk7.zmx10hfdq6qyN%roughley@hormel.vanc.igs.net>,
roughley@HORMEL.vanc.igs.net (Neil Roughley) writes:
> Error #-36 means a file is set to read-only status

No, it means "access denied". A file being read-only is just one reason
for this. In Hallvard's case, this occurs because Thing tries to delete
the directory while it still has one file in it (this is forbidden).

But don't ask me why one file always doesn't get deleted - I have no
clue. And I've also never heard from any MagiC Mac user experiencing
something like that.

Which version of MagiC Mac is running on that system, and is it a HFS+
volume?

Ciao

Thomas

Make sure your password is no longer than 8 characters. There is a
hard-coded limit of 8 characters in the SERIAL.CPX. This was giving me an
'initialising' message but would also fail to connect, as my original
password on my PC was 10 characters which the IP accepted. It was still
looking for the 10 characters but STinG was sending through only the
first 8.

3996. So when can we buy a Milan II ????????

Newsgroup: comp.sys.atari.st

Source record: 68887

Hi Bengy,

Thanks for all the great US/English support, so the bottom line which we are all anxiously awaiting to hear... when! When can we start buying Milan II's???? Can we just buy the motherboard and HD filled with OS and APPS???? Then place it into our own choice or cases??? This is the first really HUGE update to the ST line since the Falcon030 first came out and this is truly the first really up to date architecture, so instead of playing catch-up, now ST owners can play in the same ballpark as the PC's, but with a heck of lot less overhead. This is as exciting as Linux is on the x86 platforms. Also your hints about Network capabilities is a really big excitement generator. It would be great to hook a Milan up to my Belkin Omniview switch box, use the same 21" Eizo monitor as my pc AND also hook it up into my home network and perhaps even share files between my Milan and PC, use my networked laser printer and finally surf the web through a DSL connection, all this on an ST based architecture, amazing! So let everyone know when it available to ship and when orders can be placed, thanks!

Yes, I agree. It is exciting because of all of the big companies who are
actually SUPPORTING it. Did you ever think Hewlett Packard would actively
support the TOS platform again? Or Motorola? Or some of the other large
companies rumored (the last two are officially confirmed..) to be investing
time/money into the project. It is nice.

>Also your hints about Network capabilities is a really big

Yes, that would be great too. BTW Oliver Buchmann confirmed on
maus.computer.atari.software yesterday that MagiC 7 is indeed coming out!
(no release date yet) So we should know more details soon.

> So let everyone
> know when it available to ship and when orders can be placed, thanks!

Yes, Im sure people will hear about it, if not from me.. maybe from a TV
commercial, who knows? :) (hint,hint :p)

Hi Katherine

>First of all: Very good post you just wrote. (no sarcasm).
Oh, well you know me.... once in a while...;-)

>See the prob with aftp and amail is that they used MiNT specific calls
>and interface. But of course they are so generous that they had to make
>a port for magic.
To little to late if you ask me. aftp is good, I used it often myself,
but now there is Fiffi 1.20, which IMHO is a lot better, amail is
nothing to shout about.., unless you like useless features such as the
sound effects... you do realise that this "generously ported" client
doesn't do much justice for MiNT, do you?
One might think that the other MinT clients are the same quality...
Example given:
>From: kellis <kellis@leading.net>
>Date: Wed, 8 Dec 1999 14:21:50 +0000
^^^^^^
If I wouldn't know any better I might think that the client you're using
is not able of setting the timezone correctly... <grin>

>How many magic users are still trying to run it without a decent av-
>server or olga installed?
This has nothing to do with it, some people read docs, other don't.
Judging from the questions asked in this newsgroup, a lot of people don't
have a clue about AV, Drag & Drop, OLGA ...etc.

>Not even talking about the socket ovl for sting.
>CAB ovl is one of the things you are asking for. Obviously you need to
>check cab with different OVL. you will then see the "slight" difference
>between cab ovl iconnect and the mint one.
I did.... the one who works best for me is the original supplied CAB.OVL
1.7 from Sven Kopacz running under IConnect (I hear you laughing!!), try
it out with a decent configured IConfig I bet you'll stop laughing.
You'll see CAB pulling in data like you've never seen it before...

>Now, when one sees "..and all MiNT Naes crap" what do you really think?
>who brought up this discussion? where these (unjustified) comments
>necessary? who are they trying to convince or to show to the world? are
>they trying to promote a company which I do not agree fundamentally
>with, and just putting down some people who do code "better" and more
>efficiently all for the better and not the pitiful money ash might be
>making.

I just knew this was coming....
The discussion was about MagiC 7.0 that is supposed to have a TCP/IP build in stack and can adress networks. I can imagine when someone calls MiNT "crap" you feel offended.
Calling MagiC users "dumb ,ignorant and morons" is alright? cause that's what I've been reading a lot here. If every time the MagiC users would react to this, this newsgroup would be too small. It works both ways, if you want people to respect your choice, you'll have to start respecting theirs in the first place...

It's gonna take at least another five months before that MagiC will be released, specs are not known yet, and already you and the gang are breaking it down... lets come back in april-may 2000 and start the discussion when it's appropriate.

Are you really sure ASH is making "pitifull" money? ASH is very big on the German Apple market, the Atari intake is probably nuts. Its not like there are ten of thousands Atarians left in Germany, have you considered that perhaps the Apple software sales make it possible to support Atari? I know you don't care about that much, but suppose ASH would pack it in, do you really think that the Milan will be released when they are gone? ASH is the major distributor of Atari soft, when they go, the German market goes with it.... and that will affect all of us.

>If some atari users are actually happy with magic, very good. all for
>the better. Just don't think it is the only alternative, and the best
>alternative there is. Coz it ain't. Let's just put things where they
>belong. That's basically all I am asking.
Good, just keep this in mind next time you react....

>Oh yeah, got a nice experience with "TELI" whoooo the TELNET client for
>iconnect. Now of course, telnet is an old protocol, who needs it right?
>(I have heard that many times from magic users mouth, many times).
You want another nice experience? try out Chatter... what you seem to forget is that development on MiNT started much earlier, and you also have the advantage of using the ported stuff.
Teli is the first GEMbased IConnect TELNET client and it's *not* from ASH. As far as TELNET clients go I would say it's rather good. Like I wrote in my previous posting: they are building a road, you may not care for it much, because these clients are readily available for MiNT, but you must be blind if you don't see that ALL the IConnect clients range from very good to excellent.
I can understand that as a programmer you have reservations, but me as the user don't care about that, all what is missing now is ICQ, and perhaps Bengy knows something about that aswell ? :-) All I know is that I don't need STiNG anymore from now on. The IConnect clients do the job just as good, and in many cases even better (see below)

>people don't "LIKE iconnect" they might like the gem interface to set
>it up. They have no idea if they like the stack. They don't have to
>code it. They don't have any security issue, they don't have networks,
>they don't need to share drives etc. SO they don't know. All they see

>is a nice interface, it worked connecting them to the internet, that's
>all they know.
Well I know, IConfig offers you more versatality in configuring then STiNG/STIK does to start with. If IConfig is configured correctly, ALL the clients will be about 20% faster. Yes, I hear you laughing out loud Kath... I've used them both, sometimes in conjuction.
So, these guys will not only have the benifit of having an easy to set up installation but also the fastest possible connection...

>if magic becomes the standard and remain as useless as it is right now.
>cross compatibility between tos/mint/magic will be gone. All will be
>magic compatible and nothing else. So even if developers still use
>MiNT, but no users. That means that everything is gone. Who wants to
>write a program for no one to use? and that is sad.
If you ask me MagiC IS the standard, this is the difference between the programmer and the user. Take nearly all commercial software including Papyrus and Calamus... nowhere in the manuals it is guaranteed that the program will run without losing features under MinT. You don't like this? well take another good look, in most cases MiNT is not even mentioned. The same applies for freeware/shareware, the situation is better, but a lot of programmers don't care if it runs or not under MinT. This may be quite stupid, but that's reality, when the applications run under MagiC it's OK.
Mind you, I'm not saying that because something is the standard, it's the best, WIN98 is the standard OS on PC's....:-)).
You've touched the weak point of MiNT ==> the userbase, this is MagiC's stronghold. For the average user getting hold of information about MinT is not easy, let alone getting hold of MinT itself...

Little story:
Two months ago I met a guy who used to be a member of my ex-Atari club, we exhanged our emailadresses and he started to laugh, because he thought I bought a PC just like him. When I told him that I was still using my Atari, and used it for Internet access his mouth fell open.
He sold his Atari and bought a PC to be able to send/receive emails. Why you as ask? well imagine the situation.... no more dealers to get information from, no more magazines to get info, no more club, no nothing... how could he possibly know?
If he would have been an ASH customer, he would have received twice a year a leaflet informing him about the new releases. He then should have known that there were alternatives, and he would also have known that there were Atari Shows held etc...

A lot of people are in this situation, they buy MagiC, CAB etc... it's only once that they are actually on the net they learn about alternative OS's, clients ...etc. Remember the posting about Atari Computing not mentioning MinT? well all the readers of that magazine will have no idea what alternatives there are available, sad? yes ofcourse, but that's the way it is...
In countries where all the magazines are gone and hardly any dealers are left, an Atari user will very quickly become a PC or Mac user. Without

any information one is lost... Ever wondered why we see so little Italian, Spanish, Austrian ...etc guys here? do you think none of them knows English?
I know people that still use Atari and which are not on Internet, simply because it doesn't interest them, if I mention the Milan it's like I'm talking Chinese, same goes for MinT, sorry but that's the way it is..

Then there are the guys still using an ST, they're happy with it, but you know just as well as I do that MiNT is not at it's very best on such machines, MagiC is...

Another thing to consider and I'm sure you'll disagree... imagine a guy who finally found this newsgroup, and reads this posting. He might wonder what all the fuss is about, go to an FTP site and starts downloading the MiNT and MiNT related files. If this guy has MagiC installed on his computer, and he sees the mountain of files, some packed in formats he never heard of before, and when he finally starts reading the tons of docs, most written for experienced users, there is a very good chance that he won't even bother, and trash the whole lot. Now, this may be sad, but it's another fact of life... Programmers sometimes seem to forget that newcomers will not be able to manage.. Hell, I know people who can't install MagiC properly, how do you expect those guys to ever get MinT running?

To end this (I could go on writing all night) IMHO MagiC is the first step into multitasking for a lot of Atarians, some like it and never want anything else, others will follow the path of MinT/Mintnet. Whatever someone is running shouldn't make a difference, we should all be glad he's not running OS9 or WIN98.

>Good ending :)
I bet you like this one also, not so sure about the rest?? ;-)

Cheers from Belgium (no dealers, no mags, no nothing)
Dennis

I can't test it myself as I don't have ASH-mailer. I got that tip from
someone who doesn't want to be named.
I wonder if the above applies to fiffi too? On my system I can't use fiffi
with N_AES/Iconnect.

I used to live in Canada and my own feeling was that the Atari dealers in North America had a certain sleaze factor about them. They would take programs that were selling in Europe and then sell them for 4X the price. Service was pretty poor too. I could order direct from a UK shop and get the program much quicker than from Toad or Computer Direct.

That being said, I had an excellent experience with Ceejay and the Computer Dungeon who dealt in used atari hw and sw.

This is disgraceful treatment of a young man who for years has devoted much of his free time to the personal service (CyberSTrider, note the capitals ST) of shareware registrations. Much shareware stuff would not have been registered at all without him (and likewise without Joe Connor of InterActive). By now we should all have read and understood the explanation for very short delays. Denesh is as straight as a die. He does not deserve this public harrassment, which insults those of us who have been privileged to meet and deal with him.

Best wishes to all for the future.
Charles.

I don't know about STiK as I've never used it and don't know if the CPX
for that worked any differently. All I know is I was totally stumped with
STinG until my ISP mentioned that they were only receiving the first 8
characters of my password and only when I was dialing in with ST. When I
tried it with the PC, I logged in fine everytime. When I changed it to 8
characters, STinG connected right away the first time. So I checked with
Ronald and he confirmed the error. (hard-coded into the SERIAL.CPX)

My old work dial-in system used only the first 6 characters maximum
regardless of how many you typed in.

Thanks for the tip but I found that by writing to PCX format with
photoshop it reduced the pictures to just 2 colors. Then another
conversion of PCX to IMG with photoshop once more and I was all set.
This way I could do all the conversions on the PC before copying the
files to my Syquest cartridge. Checked it out and it worked fine.

Many ISPs accept only 6 - 8 characters although you can enter more than
that and the extra characters will just be ignored. The 8 character
limit with the SERIAL.CPX was hard-coded by Peter Rottengatter and
confirmed by Ronald Andersson (in our subsequent testing) as being a real
problem which will hopefully be rectified in future SERIAL.CPX releases.
My ISP accepts no limits on password length so the SERIAL.CPX limit was
catching me everytime.

4017. WAUG, Atari, And Caramel Corn: Something good from the '80s (!)

Newsgroup: comp.sys.atari.st
Date: 1999-12-15 00:00:00 UTC
From: Michael Olin <molin@mich.com>
Message-ID: <38573650.9264534C@mich.com>
Source record: 68813

WAUG, Atari, And Caramel Corn:
Something good from the '80s (!)

At least a decade ago, a small company wrote and released a program that would eventually evolve into a popular desktop publishing package for the Atari ST platform. Originally released as Publishing Partner, the program later became known as PageStream.

The original program, or one of its early updates, included some sample documents which demonstrated the program's uses and features. One of those sample documents was a recipe for caramel corn (!) which was not only a supremely tasty treat, it was exceptionally easy to make (no thermometer! no dropping glops into water!) and it was "goof proof". I no longer have the program or the original document file, but to this day I still make the caramel corn treat and share it every year at Christmas time with the remaining members of WAUG, a computer club which originated in Ann Arbor, MI and still meets regularly today. You can find WAUG on the web at:

http://home.earthlink.net/~jaysk/waug.htm

Although I no longer live near the Ann Arbor area, I managed to visit there this past weekend to deliver a batch of caramel corn for the annual Christmas Party Meeting which is to be held tomorrow (Tuesday, 14 December) night at Great American Pizza in Milford, Michigan.

So that no one need go another Christmas season without this neato treat, I am posting it here for your pleasure.

Enjoy!

Atari Caramel Corn

Utensils:

Large saucepan, cup and spoon measures, long-handled wooden spoon, 2 cookie sheets or cake pans with at least 1" sides, paper grocery bag.

Ingredients:

6 quarts popcorn (1 cup unpopped corn)
1 cup butter
2 cups firmly packed light brown sugar

1/2 cup light corn syrup
1 teaspoon salt
1/2 teaspoon baking soda
1 teaspoon vanilla
spray cooking oil

Pop corn in advance, using as little oil as possible. If you have an air-popper, so much the better. Set aside.

In a large saucepan, stir in brown sugar, corn syrup, salt and butter. Bring to a good rolling boil, stirring constantly. Reduce heat to medium and continue boiling without stirring for 5 minutes.

While mixture is boiling, lightly treat the inside of a paper grocery bag with spray oil. Place popped corn in bag. Treat the two cooke sheets lightly with spray oil.

Remove candy mixture from heat, stir in baking soda and vanilla. (CAUTION: adding vanilla will likely cause some splattering, be very careful!) Make sure the mixture is completely stirred as the soda tends to avoid the lower edges of the pan. Pour mixture over popped corn and mix gently with a wooden spoon.

Roll the top of the paper bag and place in microwave oven, preferably on a microwave-safe surface, NOT on metal rack. Nuke for two minutes, and then stir the popcorn again. (WATCH FOR STEAM WHEN YOU OPEN BAG!) Repeat this procedure twice more, nuking for 1-minute intervals until corn is completely coated. Variant: you may add some redskin peanuts during the last stir, but DO NOT microwave peanuts as they can add an unsavory smokey flavor to the corn.

Pour candied corn equally onto cooking sheets. As the corn cools, continue to stir to prevent clumping. Variant: I've never done this, but you might also form corn into popcorn balls.

That's it! You've just made a batch of Atari Caramel Corn!

The original Publishing Partner recipe called for using a warm oven instead of a microwave to keep candy hot for stirring/coating the popcorn. It was convoluted and took approximately an hour. The microwave is much faster and easier and makes no noticeable difference in the final product. (You'd have to be a Windoze user to ruin this treat!)

--
http://www.mich.com/~molin/
The recipe above is certified Y2K compliant.

>
>Yes Please. Recently seen a similar type of extractor called UNPACK 1.0
>which seems to work on similar lines - but atm doesn't here ;-)
```

It does now! ;-) and find it really good. It is by Philipp Donz&#65533;
who's written some other excellent Atari software (MagiC Conf, Cops
Terminator and Memwatch). The CFG file has to be set up first and once
done and installed in MagiC - double clicking on the file LZH,ZIP etc
automatically starts to unpack the file. Philipp said he might try to
make the setting of the cfg file a GEM program to make it easier - so
if you like the program please get in touch with him and encourage him.

```
Best Wishes
Sean

Source record: 68818

I've been holding on to it for years just in case but I'm so far into the Mac world now that there's no point in keeping it anymore. This computer was used almost exclusively for MIDI sequencing and music printing so there's not a whole lot of software included except for the stuff listed below, and a few little odds and ends. The last time I used it was about 2 years ago, though I did check it briefly recently and everything seemed to work fine. I had a TTM195 but it died a few years back (sorry), so there's no monitor with it, though as you know, any VGA should work just fine. Oh, and I think there's an extra mouse (but I'll have to check that).

-4megs ST ram (no TT ram).
-50 meg internal drive
-calligrapher gold
-LDW power
-Straight Fax
-Cubase Score (last manufactured version)
-MIDEX+ SMPTE/MIDI expander (this alone cost me over $600 in '91)

It would be great for someone who wants a turnkey MIDI system, but it can not do audio recording (to the best of my knowledge).

If anyone is interested please email me privately, as I don't monitor this list.

$250 takes all, including most, if not all, of the manuals. Shipping negotiable.

-Dan

On my Delphi and CompuServe accounts I also use a regular terminal program to
connect, either Stalker or Freeze Dried Terminal. I've never had any
problems with them or Stik/Sting using passwords over 8 characters. So I
always thought that they accepted passwords over 8 characters.

Hi,

The first edition of Atari Today, a UK paper magazine for
all Atari users is scheduled for release in January. The magazine
will be priced at around 2.50 and will include a cover disk, and
optional CD-ROM. Details on ordering, etc will be posted in
January together with our new web site.

Atari Today is a short format magazine (16-20 pages), but will
be packed with news, reviews and information from the world
of Atari. We want to keep it interesting, and up-beat.

We are currently looking for the following:

1. The Fastest Atari on the Planet.

If you think you are running the fastest Atari derived computer
on the planet. Get in touch - we'd like to feature you in Atari Today.
Your computer must use an original Atari main-board, but can
involve any kind of acceleration, etc.

2. The Fastest Atari Clone.

As above but using a non-Atari main board.

3. Developers

If you are a developer for Atari software - let us know. We would
like to feature at least 1 developer in each issue.

4. Artists/Musicians

If you use your Atari/Clone to create music and/or pictures
we would like to hear from you.

5. Atari Clubs

If you are involved in or run an Atari club, please get in touch.

Thanks

Bob F
Atari Today.

4028. Monitor Extension Connector How?

Newsgroup: comp.sys.atari.st
Date: 1999-12-15 00:00:00 UTC
From: demetrio@home.com
Message-ID: <3857a8f1.121670048@news.rdc1.ab.wave.home.com>
Source record: 68824
Cross-posted to: comp.sys.atari.st.misc;,comp.sys.atari.st

I'd like to build a monitor extension for my ST to the SM124 (the monochrome monitor) but I don't know:

(a) what type of cable to use or
(b) what the connectors are called.

Is a 20 foot connector feasible? I've done it with an SVGA connector on my PC and, despite some degradation of signal, it works.

Anyone?

Hi!

Hallvard Tangeraas <halln@c2i.net> wrote:
> What???? Are you saying that Thing doesn't allow me to delete
> directories with files in them?

No, read again. It's forbidden (from GEMDOS) to delete non-empty directories, and, as you've already noticed, for some reason the directories you want to delete still contain one file. So, when Thing calls Ddelete() (the GEMDOS system call to delete a directory), it will receive an error message because that one file is still in there, even though it should've been deleted right before that.

And as said, I don't have a clue why always on file is left inside a directory when deleting it.

> It's MagiCMac 2.1.1 (MagiC 5.11) and no, it's a normal HFS partition.

> 7.6.1

Mhmm, nothing special, even an original 68k machine. Again, as said, you're the first who ever reported such a problem. Is this machine capable of displaying real mono resolutions? If so, it might be possible to run Sys-Mon to track down the problem.

Ciao

Thomas

4032. SEE type PBEM game

Newsgroup: comp.sys.atari.st
Date: 1999-12-15 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <838g8q$rc5$1@athena.netset.com>
Source record: 68828

Someone was recently interested in a Space Empire Elite type game ran via the internet. I did some research and discovered that there is a game called Galaxy, specifically the Blind Galaxy variant. There are games currently running and it seems to be alive. Best part is that all you need to run is an email client. There are "viewers" available for other platforms that allow you to create your moves etc through a graphical interface and since it mainly just involves reading and writing text files that you mail out, this would be something that any GEM programmer could create. However these just make things a bit easier for the player.

http://www.webring.org/cgi-bin/webring?ring=glxyring&list

The above URL will take you to the Galaxy web ring page with all their sites.

Hope you find it interesting.

I'm guessing here, but the 400 series was designed to be a low cost printer using the 500 series engine. I suspect the 500C drivers in Pagestream, etc. should work just fine, considering HPs excellent printer compatibilities. For a long time I've used the 600 dpi mode of my laser driver to run my inkjet (B&W of course).

Let me know how your "new" inkjet runs.

As an Atari and PC owner, I can tell you that it's no problem reading
Atari floppies on a PC. I've done it lots of times.

Use DD (720k) floppies that were formatted with the Atari. Use the
Atari operating system to format them, not some fancy formatting
program, that way you'll be sure you have a standard Atari formatted
DD floppy. This format is readable by the PC with no problem at all.

Then copy your Atari Cubase files onto this floppy, and open them on
the PC with Cubase. I've never tried doing this part of it, but
Cubase is supposed to cross-platform compatible.

Regards,
Richard

Hmmm, I've never seen this with AW1.207. The few things I've noted are:

1) The page counting feature is not 100% accurate after about 5 pages. This is easy enough to hand edit, but it's a nuisance.
2) The page formatting is not quite perfect in that the margins are a bit off. Once you edit the margins however, the program kindly saves your settings.
3) Very nice spell checker/dictionary.
4) Database works very well in column mode. Moving things around in the other mode (format?) gets a bit annoying after the screen fills with data since the program will not auto-scroll to give you more space. I've only used files of around 100 records at 15 items each.
5) Spreadsheet works very vell for me, although my spreadsheets are at the largest 100x100. One annoyance is that the entire spreadsheet is always active, making your work generally the upper 1% of the scroll bar.
6) There is a bug in printing if you have low memory. AW does not flush the printer buffer before starting the first page (it does after additional pages) and so some low memory computers print a solid black page as page 1. This disappears with 4 Mb of memory though.

In short, AW is an excellent first attempt that really needed a V2. Nonetheless, I use it for darn near all my personal work.

4038. Serial Port Speeds and CAB

Newsgroup: comp.sys.atari.st
Date: 1999-12-15 00:00:00 UTC
From: atarigalen <kNOkSPAM@uia.net.invalid>
Message-ID: <26f15c5e.03ac23c0@usw-ex0107-042.remarq.com>
Source record: 68834

I spent a bit of time last night attempting to figure out my STing problem and remembered that someone had told me that the Falcon's serial port was only 57,600. So, I switched the setting on the .CPX, rebooted, and ... everything worked.

So, I'm off and running, as near as I can tell. My receive speeds are awfully variable though, from 1 - 4 K. Is this normal?

>

This is wrong. DO NOT use the desktop format option. On older models
this makes the floppies unreadable by DOS. The best way is to format the
floppies under DOS (not Windows) or to use 3rd party formatter with the
DOS option.

Details are in the Quick FAQ of course.

The Falcon's serial port is 230Kbps, but this slows down everything and
causes transmission errors. 115Kbps should be ok.

Actually, the Falcon can go up to 115,200, but without an accelerator,
you're likely to run into errors with it set that high, especially when
moving the mouse or doing anything else while it's downloading. But it
still should work at least somewhat.

>So, I'm off and running, as near as I can tell. My receive speeds are
>awfully variable though, from 1 - 4 K. Is this normal?

Pretty much. Depends on the current performance of the site, your provider
and everything in between, as well as the type of data being downloaded
(i.e. compressed vs. uncompressed).

Sounds about right. Denesh is NOT one to take the money and
run. He certainly wouldn't show his face otherwise. I can't
comment about the delays except I do know he is doing some
major re-organising which is taking a lot of time and effort.
Of course this shouldn't be an excuse, and everyone should
rest assured that Denesh won't use it as such and will
process all the orders.

Come on, Danny, one big push and make these punters happy!

Aargh!!

If they have to use GEMBench, the least they could do would be to compare
it to something that is among the default reference configurations.

If someone could let me know the actual timings for one of the
configurations used as reference in that table, I'd be happy to compare
it to my Falcon+AB040 with an Eclipse/RageII.
Otherwise I can give my numbers relative to one of the defaults and let
someone else do the calculations. ;-)

>Interesting benchmarks...but I should hope that the integer and floatmath
>performance figures will actually be dramatically better than that! I do

Note that this is GEMBench...

>have trouble believing that a 66MHz 060 is only 8.5 times faster at integer
>math and 9.2 times faster at float math, than a 16MHz 030/882 combo!! Else

The GEMBench integer divide test does just that.
Division speed is usually very closely related to clock speed, with
perhaps a factor of two to four extra if there is a major difference in
the implementation.
This test doesn't say much about general integer speed. For that you'd be
a lot better off looking at the 'VDI Enquire' test.

The GEMBench floating point test is much worse than that. Not only does it
mostly test seldom used things like trigonometrics and logarithms (which
aren't implemented in hardware on the 040/060), it also does this via a
library that spends a whole lot of time moving things around on the stack.
This test says almost _nothing_ about floating point speed.

>Can you provide more 'real-life' benchmarks? Like how long 'skyvase.pov'

The do provide numbers for a FreeMiNT make (about 60% faster than Milan 040)
and an STZip run (more than twice as fast).

The variability is standard, as far as I can see. It depends on the
site you are dealing with and the traffic on the network. (Doesn't
that sound technical!). The maximum speed depends on your machine.

Maybe you're right, and I've got it backwards. If so, I apologize for spreading false information. It's been a really long time since I've even turned on the Atari.

4054. Internet for my Dad's old ST

Newsgroup: comp.sys.atari.st
Date: 1999-12-16 00:00:00 UTC
From: Andrew Robinson <arobinson@westsun.com>
Message-ID: <3859985A.3F541934@westsun.com>
Source record: 68700

Sorry if this isn't the place for this inquiry - or if you've seen the question a thousand times before ... but I would like to get ol' Dads ST to run on the Internet ... at least for email

What I have so far ...

STiK version 1.08
CAB V1.4
OKAMI C1.30

However - I have all this on a PC - which brings me to question 1:

How can I get these programs onto a diskette that will be readable by the ST ?

Question #2 - The ST is only a 520 - so is there enough memory ? If not - where can I get some (I live in Toronto) ... can I cannibalise our other 520 ST ?

Thanks in advance for your suggestions

Andrew Robinson

I haven't followed the recent programs on the ST and internet, but I used ka9q sources to compile it to run on the 1040ST back in 1991 or so. ka9q had an SLFP driver which did the connection. I think there was SLIP as well but I don't think there was PPP. You would probably need PPP these days to get connected.

My system is not on anymore so I can't access the sources or binaries. You may be able to find it in the University of Michigan Archives. I picked it up there and modified the sources, then compiled it with Mark Williams C, and it worked.

As far as I can remember, ka9q had some e-mail functions, but I don't remember details of it because I didn't use the e-mail on that package. I think used UUCP instead.

>

>
> How can I get these programs onto a diskette that will be readable by
> the ST ?

Are these ST programs? If yes, then find out if your floppy drive can write 720K disks - some of them can. If not, you could buy a Floppy Drive that can write 720K disks. They are definetly available, and standard in Japan. These drives used to be cheaper than the regular ones in the US.

If all fails, start a communications (terminal) program on the ST over the serial port after you connect it to the PC with a Null-modem cable. Then start the communications program on the PC too. Use X, Y, or Zmodem transfer protocols to transfer your files fro one to the other. (You need to set the serial port speed on both to the same speed, hardware handshaking, no XON XOFF. The old ST's do max 19,200 bauds.)

>
> Question #2 - The ST is only a 520 - so is there enough memory ? If not

You can't cannibalize the other ST, there used to be memory upgrades for it
though. KA9Q is very efficient with memory, and has a small executable.

I doubt that M.E.S.S does (speedwise) some additional magic than uae. UAE
is deadly slow on an 68060/66 equipped machine (Amiga), so i asume that
M.E.S.S should also be unusable for this purpose.
BTW, how many fps should a (falcon/38 MHz) on Doom/Heretic/Hexen get? Are
the default settings the best one?

Bye, Andreas

Hello!

I would like to try IFusion in order to use other programs than
CAB and EMAILER with Iconnect.
On page 40, Atari computing, it is named as Shareware/PD.
On ASH`s pages it seems like you have to upgrade your Fiffi to 1.2
to get hold of it.
Does anyone know if/ where I can find it for downloading?

Looks cool!

Heretic also works flawlessly (other than outright speed!) on my
Falcon030 32MHz/14MB. I could not get Hexen to work because it says
it cannot find the SKY1 texture in the IWAD. The IWAD is HEXEN.WAD
which came from doomworld.com so it should work? :-\

Keep up the excellent work!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I've often wondered if someone could run 'MagiC only' software elsewhere
just by tricking the software to seek an alternative cookie other than
the 'MagX' one? I guess now lots of people will be taking other MagiC only
software and finding 'MagX' with a hex-editor? :)

> causes transmission errors. 115Kbps should be ok.

In my experience 230400 baud is not able to work for incoming data, but
when the Falcon is SENDING it doesn't appear to have a problem with this
baudrate.

I base my statement here on doing null-modem transfers to/from a PowerMac
in another room in my house. I can send TO the Mac with serial or LAN set
to 230400 8N1 RTS/CTS and the Mac happily receives that at 15-16000cps. If
I send TO the Falcon at the same speed it bombs out on sheer volume of CRC
errors, and I can only reliably use 57600 baud at which I get 4-5000cps
(less than a 56k modem is capable of) incoming...

This is with HS-modem 7 and a 32MHz Falcon...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Thanks Nicholas,
The reason I want it is Seagate.com's manuals are in .PDF.
I got a 1.7g hard drive (bare bones) on E-Bay and am lost on hooking it up!
I figure I'd ask here first (about PDF viewers) befor I started a
"how the heck do I hook this up" thread!

4068. TT: serialport as MIDI interface with Cubase

Newsgroup: comp.sys.atari.st
Date: 1999-12-16 00:00:00 UTC
From: Kasper Souren <guaka@industree.org>
Message-ID: <839c9qghq1@barba.uci.kun.nl>
Source record: 68756

Hi!

Quite some specific questions here, so I hope I get some useful answers...
I got a little cable from a friend of mine to get an extra MIDI port on my TT. But the cable was made for an ST, and so doesn't fit in my TT... I also didn't get the driver with it.
So now I would like to get the driver I need.
And I also like to know if it is working on my TT.
And when it's working I'd like to know if it's possible to also use the other serial ports as MIDI OUT's... That would be extremely cool, 4 extra MIDI OUT's for the price of some connectors...
And last, but not least, I'd like to know how I can make the cable, but then with a 9 pin D-connector instead of a 25 pin D-connector. So I need to know what pin on the 25 pin connector should be routed to the right pin on the 9 pin connector.

Greetz,
Kasper

Hi Nicholas,

Peter (STiNG) had once replied the 230K question with the answer that
the port must be use with arbitration. He didn't go into detail, but I
assume that the client would have to handle that part of it.
I run 115K no problem on our stock and modified Falcons. I have only
used a 33.6K modem on the stock one however.

Mike

It is a bug I just corrected yesterday. Now you just have to wait for
the v0.23

Please ship the untrainable dog (Snapper) and your rare bird, along with the MegaFile 30 and the Seagate. I will have the data transfered from the megafile 30 over to the Seagate in very little time. I will do most of the data transfer with electronic yogic flyers carrying each precious byte of information individually while bouncing along the sky.

The Falcon will retrieve this data and feed it to the seagate via its beak connector located at the front of the bird. As this is being accomplished I will have used my time wisely, buy purchasing some French Turbo Thing figure out just how it gets ingested into the bird. If all goes well, I will keep this Falcon thing, as well as the megafile, and return to you as promised the Seagate with all precious data transferred and in tact.

This is the exact contract as specified when you choose selection #5.
Please note that this selection has nothing to do with Mombo #5.
I can understand that you are in dire economic straits. 1ST you use an Atari and 2nd, you hope that I can train your dog to be a retriever.

Well, right you are. I am going to have the untrainable dog Snapper, learn to return parcels to his rightful owner, so that the owner will no longer have to pay for these expensive courier services. All it will take is to train Snapper, the untrainable dog, to locate his masters home in relation to the entire world and known shipping lanes.

Hopefully I won't have to train Snapper to swim.

So here it is, THE FINAL SOLUTION!

1) Goods and Furry animals sent to.

Brian the TechNOHOW?
0101110101 Hardy Rd.
Brantford, Ontario
Canada.

2) Good will be returned via.
Snapper, (Dogsled to be provided by owner)

Address as received via the Sent.

But most people don't have an Afterburner or Eclipse and I guess that's
why they have used default configurations.
They'll probably do more benchmarks when the Milan2 is released.

Hi,

to add my 'half-penny's' worth, I've run at 57,600 into a 28,800 modem
and get about the same range as you on both a Falcon and Milan. Remember
the 57,600 is only from computer to modem - from then on, the network
adjusts to the maximum possible, up to the rated value for your modem,
in my case, 28,800.

Actually, I use it as an online viewer for CAB, and although it does take a long time (you usually have to wait a minute or two - not good if you're paying your ISP per minute or hour), it does work. I still can't get it to print on my system, though. Any thoughts on how to do this? Thanks!

My point was that they _didn't_ use any of the default configurations,
so there's no way I can relate to the numbers given.
At least the (unregistered) GEMBench version I have doesn't include any
numbers with NVDI.

Source record: 68771

ALL 1040 STe's have the operating system (TOS) in ROM (either a 2-chip or 6-chip set on the mother board). The only Atari ST that was delivered without TOS in ROM was the original 520ST (model with the external disk drive and external power supplies). That model was released with TOS 1.0 on disk which was only intended as a temporary situation to last only until the TOS chips were released. That original 520ST came with Boot ROMs installed in place of the TOS ROMs.

Your 1040STe should have either TOS 1.06 or 1.62 TOS ROMs installed.

What happened to your TOS on ROM? All STe came with TOS on ROM?

Not sure if you can boot an STe without TOS of some sort? Even old 520ST
with TOS on DISK had a boot rom IIRC.

If you have no Roms, I suggest you look for new Roms vs ones on disk.

STs have always read IBM formatted disks. However use the DSDD disks and
not DSHD disks formatted to 720k if at all possible. They don't hold the
data well and don't seem to handle directories very good.

Later Brian.

Sorry, but all STEs should have at least TOS 1.06 in ROM. If it doesn't
boot up with a blank DOS formatted 720K floppy in the drive, then there
might be a hardware problem somewhere. Have a look at the Quick FAQ.

Of course with MiNT you can still run most GEM apps, although I don't
personally know which MIDI programs work and which don't.

I've done this with a lot of MagiC-only software. And in almost all cases they have really been MagiC-only ;-) Mostly because they use MagiC-specific AES-objects, but a few (very few) also calls the AES in userdefs (which is illegal btw., but perfectly possible if the AES is reentrant). I would assume that most of these will run perfectly fine under N.AES 2.0 as it supports the same AES-objects as MagiC, is reentrant like MagiC and has native support for WDialog. I don't have N.AES 2.0 yet though (German dealers apparaently don't want to sell anything, just advertise it) so I can't test this.

It certainly runs under freeMiNT 1.15.5/N_AES. There are a few minor
redraw problems but that's all.

>> long filenames.
>> [......]
>>
>Doesn't anyone have any views on this? No possible solution?
This problem happens when you have a filename containing illegal character or
is longer then 32 characters. It doesn't mean that because the filename looks
OK on the screen that it actually is. To get rid of it you'll need to use
something "stronger" then Thing.
Download the Jinnee demoversion from http://www.mani.de and get the latest
English translation from the D&D site (see sig.)
Jinnee will get rid of that file/folder without probs... Jinnee can handle
filenames up to 75 characters..Kobold can be used safely in Jinnee, just set
the desired configuration in "settings", when you copy Mac data you shouldn't
forget to set the settings for the resource fork either.
BTW: once you're hooked on Jinnee you'll never want to go back to Thing.
Jinnee and MagiC were made for each other... a perfect pair.

Cheers from Belgium
Dennis

LADIES AND GENTLEMEN, if I could have your attention for a moment.

I'd like to propose a digital toast, and of course best seasonal wishes, to one of the long-standing assets to the Atari community in general, and this newsgroup in particular.

Those of us who have been subscribers to comp.sys.atari.st for a while know that the success or failure of a particular computing platform has less to do with the long term design success of the manufactured item, but rather the people who sustain and build a community of support.

Denesh Bhabuta has been one of the central players in sustaining the Atari platform's continuing enthusiastic community of support - worldwide.

CyberSTrider has for years - how many is it now? 5? 10? - been pivotal in providing a network of software developers with the means to receive financial support for their continuing efforts - on our behalf.

(I can remember when I first installed Selectric on my STfm, how that showed me that this machine was capable of being improved, that it had some potential. And that there were people online who could help.)

Who provided the means whereby the authors of these programs, and many other - well, - essential pieces of Atari software, get the shareware monies they deserve, even those from overseas.

And now, Danny has launched his own business - something that will require his skill and attention, coupled with his talent and desire for fostering a community. Something that will allow him and his family to see some justly deserved rewards from hard work.

Unfortunately, that means that his care and attention to the Atari community will have to take a lesser priority - and that is our loss.

We are a dwindling community. We know it, and sometimes that makes us a little snarky with our elders - that's just bad manners.

The real tragedy here is that we are losing someone who's been one of the mainstays of our little group here.

Denesh: Thanks so much for being there. All the best for now and the future.

Ladies and Gentlemen: Denesh Bhabuta!

I got Star Glider with my first Atari in 1986. By leaving the game
on and hiding the spacecraft in a shelter while I was at work etc,
and constantly replenishing enery and shields, I managed to get to
some very large score (117,000 maybe). What did I get at the end? -
some message asking if I had used the cheat! Didn't even know there
was one.

Please don't let a few impatient users fluster you. I've recently
moved and it's NOT fun. Things go wrong, people don't show
that promised to help, loading trucks arrive late... any number
of things go wrong.

I'm just glad you are still here! ;-)

I've seen some disturbing posts about dealers I've dealt with
and not one "ripped me off". I must be lucky I guess. Not saying
service was perfect, but I got what I paid for eventually.

Anyway people do move on, we Atari users should be used to it by now.
If you do move on eventually, then I for one am glad you are doing
well. Good luck in all your ventures... in life and others.

I disagree here, the Hades060 has been around awhile. Costs more
yes, but here long before other 060 clones. It is good to have
other options however. ;-) Perhaps the Milan release will force
the Hades price to drop. Who knows.

> At least the (unregistered) GEMBench version I have doesn't include any
> numbers with NVDI.

GEMbench (I also have used unregistered) gave strange results on my Falcon. It didn't give NVDI the obvious justice it deserved because VDI/text/graphics/blitting were not much better after switching NVDI on, despite the very obvious increase in screen redraw speed we get when NVDI kicks in...

System Solutions had the right idea when they first advertised the Hades060. They listed a good selection of realworld tasks and compared times to complete these, against Falcon/ST/TT/Pentiums etc...I found the POV-ray one interesting because a render that took 24 hours on a stock TT030 was cut to just 16 minutes on the Hades... ;^)

Realworld tests are the only true benchmark...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Brian, Joe, Tom,

Thanks for the input.

Brian - Thats one I could never figure out :~)

Joe - checked out UMich and couldn't locate

Tom - Thanks for the attachecment on e-mail on your contribution

All of this is the reason I stick with Atari,

I just want to thank everyone here for showing how a NG should be run. I am on a few other NG's and the netiquette, flaming, OT posting and general level or professionalism is so poor that I wonder where these morons come from. Since joining this NG I have been bowled over at how great you guys are. Now I am M$ using scum who should be shot. ;o) I came here to learn a bit more about Atari's as I have a friend with a motherload of them and considering I am studying for my MCSE (M$ certified systems engineer) cert. I want to learn more about other systems in order to better understand computers in general. The people here have been courteous to me and very helpful considering my inexperience with Atari's. I fully admit my lack of knowledge on most of this NG's topics but try to put in my two cents when I feel I have something to offer the rest of you.
Thanks to all of you and hopefully I can join the ranks of Atari users at sometime in the near future. (I have an offer from another poster here to borrow some equipment)

Steve

Steve - some (maybe quite a few) of us use other platforms too, but most all got their computing start with Atari. For me it was a 1040 Stf I bought in 1986 - almost the Juassic era when dealing with computers. And while I have a multi gega hertz AMD based PC sitting on my desk, I still do most of "serious" computing using my TT030 and Atari programs that I have aquireds. I would say that over the years from the Genie and Delphi text based forums to the current state of affairs with the Internet, the Atari user groups have uniformally been some of the best that I have delt with. Oh, there are the fanatics :), but they have their own newsgroup(s) and when they occasionally show up here, are politely asked to keep their posts elsewhere.

Anyway, welcome to the group. As you get to know the Atari and its various flavors of operating systems (or enhancements as some might refer to them) you begin to realize that Windows isn't all that special :)

I don't know if there was an attachment(?) That is why I am here. You guys seem to know stuff that the rest of us M$ dummies are too stupid to understand. ;o) There is so much I have to learn yet and when it comes to netiquette this group has really opened my eyes. Trust me I got an earful for sending HTML text to a friend of mine who is an Atari user. Wow!

Steve - The thing that "bugs" most of us non Windows exclusive computer users is the lack of knowledge many have about other computer platforms and operating systems. By last count over 12 million copies of Linux had been distributed (and that number is most likely outdated). E-mail, which the last time I looked, is suppose to be a text based system sure gets it full of html, Power point and other file systems. The problem Windows users get into (sometimes) is that the "default" value for the MS e-mail programs is to send e-mail as html files :). You can change it in one of the preference screens, but most users don't even know it is happening - until they get "yelled" at by a non Windows/Mac user :).

The company I work for uses Novell servers. As such our company e-mail system is Groupwise. Some genius in our head office decided that the companies "offical" WP program was going to be MS Word. So most people, when they send file attachments of company policy changes, notices,etc., use MS Word. Can Groupwise decode MS Word documents - nope. You have to drag the things to the desktop, then open them in MS Word. Its a small thing, but after a while it gets to you :)

So, when you have questions - just ask away. If it is something that has been asked a thousand times before, you may directed to a web site with FAQ's covering the info you are seeking.

I don't think it does. I tried it once. Cubase really doesn't like
multitasking environments because it already uses it's own internal
multitasking engine.

STIK is oooold. You need STinG nowadays.

CAB is for the web

Okami is a mail/newsreader, but is not a standalone package. You will
need popwatch and newswatch to actually download the mail and news
packages.

>

> other 520 ST ?
>

Nope and nope. You really need at least 1Mb, and the getting online with
just a floppy drive is going to be painful. STEs are easily upgradeable,
but if it's an ST or STF, then it needs extra hardware to be upgraded.

This is in the Quick FAQ

Hi Bob (me again)! Wonder if theres program to tell what the actual connection is (while running CAB). Like the clock program that shows the date/time in the upper right corner of the screen except it would show your modem to ISP modem rate. The Supra 28.8 had a display for that but the Supra 56k does'nt!

Actually the N.AES V. 2.0 (version of this years ATARI fair in
Hannover) has a few minor problems (espacially with MultiStrip - it
doesn't accept its own key) so I suppose Mr. Woller first wants to
eliminate these bugs before sending N.AES to foreign countries.

Tschuess,

Frank

Play Tomb Raider ;-)
If Mario would program such an end sequence I guess he would have to
spend more time programming those dancing girls than the game! And
don't forget the dancing boys for all female Atari users out there.

BTW, it could be worse: I played through over 100 level opf Puzznic
(NES) and the end was a black screen displaying the words "GAME OVER"
in white.

Greetings,
Matt.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

(Update: 12/17/99) I'm calling on my regular and repeat customers for help. This is a slow time of year for me. I've had customers start on orders and either cancel or postpone their order because they needed to use their Money for the Holiday. Regardless, I have bills that are being neglected and unlike Congress I can't levy a Tax. That's why I'm counting on my Customers to help me make a living. Currently I have a bunch of new ST Software come in. Both New and used. I just need time to process the new inventory. So keep an eye on my Catalogs to find what's new.

(Update: 12/09/99) I've just added more 8 Bit Software to my Catalog. Financial, Budgeting & Print Shop Software. As well as some Spoken Languages and a few Games. I've added another set of shelves to hold it. Also I was holding some software for a customer but due to lack of interest that Software is available again (Archon, Seven Cities of Gold, etc.). Most of these additions are $5 a pop.

(Update: 11/18/99) I've just added more 8 Bit Software to my Catalog. Programming Languages & DOS's from OSS, HOFACKER, Alpha and even Atari MicroSoft BASIC & Atari LOGO. Lots of Utilities & Copiers like Chipmunk and Impersonator. My Catalog is growing by leaps & bounds.

(Update: 11/04/99) I've just added a bunch of Titles to my Atari 8 Bit SoftWare Catalogs. All Games!!! A number of them are UnOpened! Many for only $5 a pop! And I went through my Catalog and did some adjusting of prices. Right now my 8 Bit SoftWare Catalog has a bigger Byte count than ever.

e-mail: atari@benjamin.net

Or call me anytime at (503)256-9974 to talk to a warm, friendly, people person! Your more likely to reach me from 3 PM-3 AM Pacific Standard time. And thats most likely the times I can return calls. I'm perfectly willing to call you, on my own dime to answer your questions. I'm a people person and those who have dealt with me will find me patient, a good listener and even a good teacher. So if you can't call me Today? Call me Tonight!

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact check it regularly as my Catalogs are updated regularly. I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. And remember if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, January 13th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

Hello,

For the internet related questions,
try this Email address: oliver@application-systems.de
Application Systems Heidelberg is the vendor/producer of CAB.

About the canibalism: AFAIK, it should work. But might require
a lot of specific kwowledge/skills. The 520 should be "expandable"
to up to 2.5 MB. Thats at least what I heard about it.
I never tried it myself...

Greetings Goetz

4133. Cubase Audio Falcon?

Newsgroup: comp.sys.atari.st
Date: 1999-12-17 00:00:00 UTC
From: Paul Flieshman <P.L.Flieshman@student.salford.ac.uk>
Message-ID: <385A216D.507E1DA3@student.salford.ac.uk>

Hi there..me again, with my latest stupid question. Has any body got a cheap copy of Cubase Audio Falcon? I just can't run to paying nearly ï¿½700 from system solutions. That's more than you'd pay for Cubase 24 on PC or Mac. Any ideas?

Sorry to sound like such a whinger,
Paul Flieshman
3rdkind production team

4137. Memory Upgrading / RAMDISK ?

Newsgroup: comp.sys.atari.st
Date: 1999-12-17 00:00:00 UTC
From: G T Martin <greg@abmlimited.clara.co.uk>
Message-ID: <KHp64.523$9w.10561@nnrp4.clara.net>
Source record: 68733

Hope these questions are clear! Anyway.......

1) I have a 520ST with 30 pin SIMMS, are these normal PC 30pin SIMMS?, as I also have an ST1040, the only difference between this and the 520 is that it doesn't have any audio phono plugs on the back, will this also be using SIMMS as its memory as well?, and can this be upgraded with PC 30pin SIMMS?

2) If this is the case, and I put say, 4mb of memory, is it possible to create a Ramdisk with GEM?

Regards,
Greg

This is the place. And you can do it, just barely.

>What I have so far ...
>
>STiK version 1.08

Replace with STing version 1.08 and Above. It handles PPP.

>CAB V1.4

No version of CAB will work in only 512K. Version 1.5 and 2.7 demo are
available.

>OKAMI C1.30

Ant Mail works on a 512k machine, at least it did when I tried it two years
ago with STing.

>However - I have all this on a PC - which brings me to question 1:

Why do I own a crappy computer:-). Opps sorry, not the question I thought.

>How can I get these programs onto a diskette that will be readable by
>the ST ?

Format 720K on PC and copy files to it. If you 520ST has only Single sided
drive things get tricky anymore as PCs no longer support this I am told.

>Question #2 - The ST is only a 520 - so is there enough memory ? If not
>- where can I get some (I live in Toronto) ... can I cannibalise our
>other 520 ST ?

I don't know where you can get memory, but I have lost mine:-). Only if you
are a very good hack and want to solder memory on top of Memory, I wouldn't
advise it. The cost of memory for an ST will cost you more than a used
1040ST or MegaST. I am picking up a 1040ST and 30Meg hard drive, two
monitors colour&mono, for $40CDN.

>Thanks in advance for your suggestions

There are limitations as mentioned in previous messages in this thread. The
ST 19200 limit. You will require HS modem as well, which is software.

I will give you as much help and possibly hardware as you require to get on the internet.

I live in Brantford, about 1 hour west of Toronto.

I should be at the Toronto Atari Federation meeting in January.

And as far as I am aware, I am the only TOS 1.0 520ST user on the internet.

Later Brian.

Nicholas, It works under MiNT. (at least CAF 2.06 with audio disabled).
However, few redraw problem as cubase installs its own screen.
And not extremely stable to work on a full song. So technically it works,
but not recommended.

As far as linux midi/audio editing software. Not a whole lot very
promising. Maybe "Brahms" ? (no audio though, and MIDI editing somewhat
inferior to the old cubase score on an ST. The future will tell, it is way
too soon right now.

Yep, I noticed that. Glad I'm using the excellent Taskbar, which is IMHO
far better then Multistrip. I realy dislike that slow (Window$ feature ?)
appearance of the popups.
Anyway I hope that's one of the reasons why Woller doesn't send N_AES
abroad but why doesn't he (and Axel Gehringer) tell this to the people who
has send him a mail?

I don't know much about Cubase products but Cubase Score for instance
WORKS with N_AES/freeMiNT 1.15.5 (in 256 colors) but not with MagiC.
However it seems it has problems with the Nova graphic card driver
(sta_vdi). The buildin screensaver of the driver interfere with Cubase,
even when this option is switched off.

Yes, it is supposed to work on a Falcon as NEWsie is developed on one if I
remember correctly.

This very feature is what I wanted to try out, which is why I wanted to
read the offline messages in the first place. Anyways, there must be
something I am overlooking as well, since I can't get this operation to
work.

Better do some more reading, I guess. There is some obvious reason why.
This is a very handy feature to have, that is for certain.

Hi Steve.

Welcome aboard. Try this URL for Older ST software.
http://www.umich.edu/~archive/atari

Lots here to keep you busy.

Later Brian.

P.S. Now that you have figured out how to get news on the PC, you can take
a step forward and get news on your ST if you are adventurous.

Actually Charles, that just might be the best assessment of the data. I personally had no intentions of drawing any deep conclusions, it was just an effort in sleeplessness after a long nightshift. I was pleased to see it followed through properly.

Now, you have me wondering what the breakdown in other NGs might be like. Probably very uniform. I definitely enjoy the diversity seen above.

Definitely a Computer/Global mindset to say the least, with a nice Atari Slant:-).

Not sure if it was a taster, but both ST User and ST Format had it on
one of their coverdiscs. ST User even had v2 on one of their discs.

Hi All,
In case someone who knows and has'nt been reading all the posts,
I'm wondering if there's a program that would show the actual connect rate
between my modem and my ISP's modem which can be viewed while runnuing CAB
(as some date/clock programs show in the upper right corner)!
The Supra 28.8 had a display which constantly updated but modems like
the Supra 56k lack that.

Ja, ganz einfach. 256er Eprom mit 120nS Zugriffszeit.

> wo bekomme ich ein TOS 2.06 her, das schon entsprechend gesplittet ist,
> sodass ich es brennen kann?

Die Arbeit kannst Du Dir sparen, TOS 2.06 hat eine andere Adresslage als
das sonst ï¿½bliche ST-TOS und lï¿½uft nicht ohne weitere Hardware in einem
alten ST. Ausserdem wï¿½re es noch immer eine Raubkopie, auch wenn es
verschiedentlich so zu finden ist.

Das ganze gab es mal fix und fertig zu kaufen. (TOS 2.06 Card) (Od. so
ï¿½hnlich, mï¿½sste ich nachsehen, steckt hier in einem ST)

Es gibt auch eine Selfmade-Umbauanleitung..
Allerdings ist das nicht ganz so einfach.

Gruï¿½, Robert

I still have my ST running SPectre and a Mac side by side. Can't remember, though, is the format you talk about readable for the ST under GEMDOS? Or is it readable only when Spectre is running?

In any case I found the most reliable way to transfer files using a null-modem cable and STalker on the ST and ZTERM on the Mac. The Mac emulation can also run ZTERM.

If you can be a little more specific (about how the disks were formatted) I might be able to reproduce your problem.

As far as i remember LAPD was closed a few month ago. Many of the programs
distributed by LAPD and other PD libraries were freeware or shareware
so you can find them on any good atari FTP site. I don't remember
adresses but try launchpad.atari.org. It is a site with maaany links to
atari-related sites and pages.

I am going by memory here because I haven't used gemgs for awhile
now.For some reason I cannot get ghostscript(or gemgs if you prefer)
to work with fontgdos.I had the same trouble with printing but I tried
the following I set up all the configurations to the type of printer I
had and then printed to a disk file. I then printed the disk file and
everything came out fine.Like I said before I am going from memory
and so I'm not sure but I think gemgs ran better under mint.

I have a printout of the Umich archives. It doesn't list all the programs
that are their as not all programs are actually in the index listings.

However, without actually going to the site, I was unable to locate the
program as I too am interested in it.

Sorry Brandon, just an RF modulator. It is pretty crappy but will do if you
don't have a monitor, and want to play games. Not much else though.

There are other adapters to get composite output. And someone in cleveland
ohio has created an S video output.

Not certain just what your needs are, and I always seem to assume like
others.

So I guess you are looking for an RF modulator for your ST.

European users hook up a SCART connection, which I know nothing about other
than the picture quality would be better than RF provided by atari.

Later Brian.

Do they really charge that much ? I haven't seen their published price for a long time, but if you haven't contacted them recently I should get an up-date on the price.

From your e-mail address it looks like you are a student. Have you checked the prices charged by the educational suppliers ? Perhaps your college/university could order a copy for you ?

Cheers

Paul

Hi all,

I am trying to import IMG-graphics into a RSC-file to use as icons, and
everything seems to work OK, except that the palette looks like...
...well, crap. :(Isn't the palette saved with the IMG-file? (I am using
256 colour images) I save IMG-files from GEMView, and try to import them
into resourcemaster.

Please, please, if you can help me on this one, get in touch!

Thanks in advance! :)

/Joakim

4182. Help with use of TV with MEGA/STE

Newsgroup: comp.sys.atari.st
Date: 1999-12-18 00:00:00 UTC
From: composer22@mindspring.com
Message-ID: <385ba380.56829249@news.mindspring.com>
Source record: 68632

Can anyone in the group give me details about how to use a regular television with a MEGA/STE? I have three ST monitors which don't work (two SM 124s and an SC 1224). I bought an RF modulator from Radio Shack and tried to interface but I'm still not getting the ST screen on the TV. Perhaps someone will also know if there is any help online for ST users.

Thanks for any help,

Al.

4183. Mega 4 STe for sale.

Newsgroup: comp.sys.atari.st
Date: 1999-12-18 00:00:00 UTC
From: Don Schmidt <dschmidt@pacifier.com>
Message-ID: <385bb864.0@news.pacifier.com>
Source record: 68633

The time has come for a new owner for the Bear Cavern BBS's equipment.

The following Atari equipment and software are for sale for $500 plus handling and shipping.

Optional: Will include an APC BackUPs 400 UPS for an additional $40 plus handling and shipping.

1 Atari Mega 4 STe equipt with 50 MB hard drive, Ajax chip, 1.44 floppy drive. With a JinMouse (better than an Atari Mouse).

1 Atari 14" swivel base monochrome monitor.

1 Atari SC1224 color monitor.

1 1.1 Gigabit Seagate SCSI Toad Tower Hard Drive with Adaptic card.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
This hard drive is the one used with the BBS and contains several hundred Atari, MSDOS and Windows files.

1 540 MB Quantum hard drive with an ICD II adapter.
Built in the same box, a Viper 150 (uses 250 mb tapes) Tape Drive.
Built in the same box, a 750 kb floppy drive. The floppy is good but the cord length makes it unreliable. Best to remove it and use it as intended.

The BBS software is BB/ST by Quantum Microsystems. Old but reliable.
The program has been improved by Anthony Watson (Mountain Software), improving the file library and the File attached Mail.

Maintenance software on the BBS includes, Diamond Edge, Diamond Back, ICD Pro Utilities, SCSIWAIT 3.

Two external SupraFAXmodems, 1 v32.bis and the other 33.6 (these are the ones with the display)

Dozens, if not hundreds of 750 kb disks with commercial software, Magazine files, and STReports downloads and manuals. (Also the Best Electronics catalog).

Cords, powered monitor switch (will switch from one monitor to another including the AC)

Mega STe Field Manual

Lots of software

Hello,

I plan to use my good ol' MEGA-ST4 for simple textprocessing
tasks. For this I am looking for an application that supports
HP's PCL. I don't have any idea which software I should use.
Is there free software doing the job? If not, how may one get
software, that isn't sold anymore, legally?

Thank you.

Wholehearted agreement here. Can't remember if I've registered any
shareware with CyberStrider, but I have had a couple of email
conversations with Danny in which he has always been helpful way beyond
the call of duty. Anyone who thinks CyberSTrider or InterActive were
huge moneymaking schemes needs a reality check. It's obvious both Danny
and Joe Connor were putting in *much* more than they ever got out. Give
the man a break.

And the man rescued the entire Hensa archive when Hensa got rid of it,
at a time when Atari archives were disappearing like the snow in summer.
For which act alone he deserves a permanent place in the Atari hall of
fame.

I think CAB's print dialog has an option for printing images or not - make sure you've got it selected correctly.

You don't mention GDOS (or NVDI after v3 or SpeedoGDOS, etc...) -
AFAIK you can only print from CAB with GDOS.

Cheers,

Ashley

Hello Peter!

Thanks for answering my request ! :)
To be more precise, Spectre disks are formatted under the emulator but it's possible to copy them with any serious ST disk copier (such as Procopy, Acopy...) ... I don't know precisely how these disks are formatted, but it seems that the emulator doesn't use the cartridge hardware (except the roms :)) when it needs to read/write such disks.
It's not possible to read spectre disks contents under gemdos : erroneous free space info, unreadable data (0 objects...).
I think this disks are a kind of "image" of original Mac GCR converted in MFM format.

My will is to be able to extract mac files from spectre disks without using spectre, and particularly to do it with a PC.

But I don't know where to get more info, or to ask the most famous Dave Small about this. ;)

Thanks again,
Yves.

And more importantly, CAB can't print *images* with SpeedoGDOS (at least not with my version 4). Only text. This may be the problem, if he can only print text. If images are important, use NVDI.

Rendering is math intensive, so you are right on target when guessing
that the CPU and FPU benches are the benchmarks that most impact on this
activity. VDI scores would only effect the drawing of a finished
picture, which is neglible since the finished product is stored as a
raster image file.

Your TV jack on the back of the STE is the RF modulator. You need the video cable with the male RCA jack on each end to plug between the computer and the TV swithbox such as those that came with the 2600 video game system which provides ohm matching for the input on your TV depending whether you are using the two antenna screws or the screw on type antenna connector for VHF input. The STE should have a switch for chosing channal 2 or 3.

Brandon:

Since all STEs already have the RF modulator built in, you just need a straight connection between your STE and the TV's antenna/cable input.

You can buy an RCA female -> Coax male adapter from Radio Shack.

Get yourself some good shielded RCA cable while you're at it!

Connect your STE up to the TV, tune into channel 2 (or 3, possibly) and boot your Mega.. enjoy!

Derek

P.S. If you want to run demos and such that demand 50Hz, you'll want to use a TV with a vertical hold adjustment. Many sets made after 1990 or so don't give you this option!!

I suppose the desktop program deletes the files first, after that the then
emptied folder.
So, whenever 1 of the files cannot be deleted for some reason,
neither can the folder.

I got the hp 420c printer yesterday, so far I've used it with imagecopy4 to print with. This was/is a brand new one sent to me by one of my SIAR members. I've not dug out all of my DTP disks yet, I know I've got timeworks, TW2, fleetstreet 2, pagestream 1.5.

I know there was one on two of the disks from the disks from an english atari magazine, but I seem to have #1 disk but not #2.

What I'm looking for is one that allows me to not only include color graphics, but color text too. This is for the SIAR's Stellar Winds Newsletter.

BTW, how long do these inkjet ink carts last ?

Dear Brian,

I live in Prescott, Arizona which is 115 miles north and 5000' up from
Phoenix and 78 miles south and 2000' down from Flagstaff (slightly west of
the center of the state). No swimming would be involved but it is a bit of a
drive! I have no idea what systems are going for so make me a fair offer
and let me know where you live. We are planning a trip to the east coast
after the Y2K meltdown, maybe we can meet part way.

It has been rather chilly here, but just seeing "Canada" in your e-mail
warmed me right up! ROFLOL! I love snow and it looks like we are going to
have a warm, dry winter so I may have to go look for some.

Waiting
Jan

Hi Dennis,
On the injet cartridge, one point to keep in mind is to use it as often
as possible due to an internal dry-out problem (even if it's full and you've
cleaned it externally).

Greetings all,

As many of the good old games from the PC is showing up on the Atari
I figured some people would like to see some proper icons for them as
well. On my frontpage you will find 8 icons from Doom, Heretic,
Wolfenstein and Quake. Enjoy! :)

Oh, almost forgot, merry christmas to you all!

Regards,

Joakim

I have used GEM-view 3.16/3.17 extensively for 2 years now, and its a
fine program. One thing always has annoyed me...what IS the STANDARD
256 colour system palette? This issue I have not been able to sort
out, because always I cannot get software retaining the system palette
when I have created 256 XIMG piccies for my old MagiC desktop. I'm
having trouble as well with 16 colour XIMG pics and converting them
to CICON's for use as desktop/window icons. Is there a standard for
the Atari system palette? If there is, no 2 pieces of software seem
to have the same interpretation of that...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> To display my ignorance completely what aspect of the GemBench test would
> relate to the POV-ray aspect, VDI Graphics, Float math or what?

Normally float math. Raytrace programs can require massive floatmath ability
with your CPU, to create 3D rendered scenes in anything under hours or
even days on even 'fast' Atari's like TT/Falcon. POV-ray 3 is a perfect
example of a program that loves a fast floatmath unit in a computer.

The GEMbench results on the website told us that the Milan060 was 9 times
faster in the floatmath test than a stock Falcon with FPU. A Falcon is near
half the speed of a stock TT when doing POV-ray renders, yet a Hades060 has
been timed at >>90<< yes 90 times faster than a stock TT! Isn't it ludicrous
that the benchmark program is so far short of the REAL result?!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

|software, that isn't sold anymore, legally?

Any text editor will do. Everest is the one I use but qed, Edith etc
are also popular. If you specifically want fancy fonts, images etc
then Papyrus - but it is not free and you also need to buy NVDI or
equivalent.

In an .RSC file there is no palette attached to an image. The current
("standard") palette is used.
If you want to use this image in your own program, you have to setup the
palette after the resource is loaded.
If you want to use this image ion the desktop for example, you have to fit
your image into the palette you use at display time.

Nobody in so many words. However, certain parties have been acting as if the shareware registration schemes were full-blown commercial enterprises instead of being small-scale businesses run by dedicated people in their spare time, for the benefit of Atari users and shareware authors (effectively as a public service).

Danny has already explained his circumstances and the reasons for the delays, and yet some people seem determined to portray him in a bad light. I think this is appalling considering his track record.

Try renaming gemgs with an app or prg extender. Then you can see in the
console window if there are any error messages reported (such as font files
not found??)

hello
I keep battling on I hope someone can give me a little more
ammo. Trying to connect to ISP free-online, my guns running out.
I connect successfully to Freeserve :) Using Sting 1.15
Tried many different combinations of the Dialer SCR, the
best I can get is to where the modem displays Initialising
Link, but then times out. I have been to WWW. rottengatter.de
and downloaded all Sting from the download bay, there seems
to be no different version than 1.15 ??
I have phoned the ISP helpline at 50p per minute,
here my bullets really went low, no help here.

In the dialer script it asks for Client IP, but the address
from Free-online is server assigned, so I am unsure what is
to be entered here, I have tried 0.0.0.0.
Regards BILL

4222. TT030 questions...

Newsgroup: comp.sys.atari.st
Date: 1999-12-19 00:00:00 UTC
From: s_roth@sprint.ca
Message-ID: <s_roth-1912991427330001@spc-isp-osh-uas-04-40.sprint.ca>
Source record: 68672
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am interested in using an Atari TT030 for MIDI MTC'ed to my Macintosh G3 ProTools Mix system to avoid using OMS. Therefore, I have the following questions regarding compatibility, expandibility and networkability of the TT:

Does Cubase or Notator (original or Logic) work with the TT?
Would they run in ST or TT mode (if there is such a thing)?
Would they use TT or ST RAM?
What is the maximum TT RAM expansion?
What is the maximum ST RAM expansion?
What kind of SIMMs (if at all) does the TT use?
Does C-Lab's Unitor2/ExPort MIDI expansion interface work with the TT?
Does Steinberg's MIDIEx work with the TT?
Is the TT networkable to a Macintosh G3? How is this accomplished? What protocal is used?
What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?
When networked, is there a way for the TT to access my Mac G3's adsl connection?
What is the largest capacity harddrive that the TT can have internally?
How many SCSI devices can the TT SCSI controller access?
What solutions are there for accessing multiple SCSI devices on the TT?
Is the TT easy to rackmount? In other words, is the motherboard small enough to mount in a standard rackmount case?
Is the TT easily moved into a PC-style case?

Thanks in advance.

That would probably be Timeworks as given away with ST Review.

In which case forget Timeworks: it doesn't have any colour support
AFAIK. Similarly the original Calamus and Calamus S. Not sure about
Fleet Street and Pagestream, but I would expect Fleet Street to be black
and white only.

Calamus SL has colour support, as does Papyrus (from v4 onwards). DA's
Layout does colour too, I think. All of which are expensive, unless you
can get a good deal second hand.

Hi All,
Got it! Used it as an 'External Viewer' in CAB (added *.pdf).
Connected to Seagate.com. Clicked to download. Ghopstscript kicked in fine.
And after about 15 minutes of Ghoscript loading and PDF loading (still on
line here), there it was. A pic of a PDF file. Everything in Ghostscript
seems to be in German (no Eng.RSC ?). Clicked wrong button and a half hour
later (now dropped by ISP) a blank page. Gotta' experiment with a smaller
PDF file (this was 700k). Any way, thanks all for the input,
John

4226. Re: Help with use of TV with MEGA/STE

Thanks. I had no idea the STE had it biult in; no wonder it didn't
work with the RF Mod I bought. I'll try it and let you know how I make
out.

This is probably totally unfeasable but thought I would say it anyway :-)

I think it is recognized we have a problem obtaining English versions
of some of the great, mostly German software. Could it be possible for
a scheme to be put in place where say Transaction/D&D are connected with
CyberSTrider and software authors under a variant of the Credit Card scheme
mentioned above by Denesh (Online/+ Answer phone only).This would also have
to take into account the great work done by the translators/CyberSTrider
financially, via a fee being included in the price of the software of which
any register keys/Software would be sent via email only to cut costs.
This would hopefully encourage more authors to join the scheme due to
increased and easy payment, reward the translators financially and help
them to continue to do so as well as trying to lessen the workload on
Denesh (hopefully, so he can get some sleep!) and making sure that it would
be slightly more "profitable" to run. It would mean paying more, but in
the long run may encourage more new Atari software to be written and
accessed by everyone.
Just a thought.....I can dream can't I :-)

Best Wishes
Sean

Update on above:
In Newsie---Setting News prefs (max. to fetch/view) to 999/9999 seems
to be half the problem. Resetting to 900/900 fixed the worst case of only
getting the previous month and shortened post lists (on all three sercers).
I have'nt totally compared all yet though (for differences in what's there
or not).

Message-ID: <385D47EF.31C38D34@musikschule.net>
Source record: 68680

Hi!
I have a problem with the atari-port of gcc. The compiler runs
correctly, if my code is not preprocessed (I get only a message of
unknown # commands, but that is ok). But if I try to compile
preprocessed code, I get the nasty atari-bombs (the compiler chrashes).
I tried also g++ with the same effect.

Thanks,
Matze

4231. WANTED: Ext. SCSI HD/CDROM

Hello,

Does anyone have an external SCSI CD-ROM drive (even one of the old Apple Caddy ones would do, as long as it still works ;-) for sale? I am also looking for an external SCSI (or ACSI) hard disk to use with a 1040STe.

Anything available, which might be posted to Ireland?

Thanks,

Jerry Martin

4232. Re: Spectre floppy disks

Newsgroup: comp.sys.atari.st
Date: 1999-12-19 00:00:00 UTC
From: John Kolak <jkolak@jps.net>
Message-ID: <385CAF15.672E2AD0@jps.net>
Source record: 68682
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

If I recall correctly, it seems there was a utility with the Spectre disk allowing conversion from Spectre to Atari. I recall using the procedure to produce Postscript files under Pagemaker and then converting them to Atari format for printout with Ultrascript on the SLM laser printer.

Forget about Dave Small. He occasionally pops up on AtariCentral to drop in a message, and equally quickly disappears. He won't even answer an email. He listed his web site, but I deleted the bookmark since he doesn't respond, and is no longer involved with atari.

Jean LUSETTI (jlusetti@free.fr) wrote:

: In an .RSC file there is no palette attached to an image. The current
: ("standard") palette is used.

The Interface resource editor supported a non-standard extension whereby a colour palette applicable to all CICONs in the resource file was stored in the file. But of course you had to load and evaluate the palette data yourself, since the AES does not know about it.

The quality of newsfeeds is very variable. I was getting only about half
of the messages in this newsgroup, and none at all in some other groups
with my previous ISP, but my current ISP has much better newsfeed and I
don't think I am missing anything significant now. I think Deja News and
the like are a good reference to check what you are missing.

Hi Martin,

MH>How do you print the current page from CAB 2.7 INCLUDING graphics?
I was told than one frame in a page is regarded as one page for the
printer so a page with a lot of frames will cost a lot of paper.

Therefore I avoid printing from CAB.

Peter

>tracks
>note that you can run Cubase Audio Falcon on any Atari in midi-only mode,
>so if you dont have Cubase yet, look for Cubase Audio Falcon or Cubase Audio
>CBX

Falcon? I never mentioned the Falcon. I will be sending out MTC (MIDI Time-code) via my Digidesign SMPTE Slave Driver to synch the TT with my G3 Mac running ProTools.

All I want the TT to do is MIDI. That's all! I'm sick of the sluggishness that OMS in ProTools provides. And I'm also sick of the horrible automation that Logic Audio provides.

>> Is the TT networkable to a Macintosh G3? How is this accomplished? What
>> protocal is used?
>dont go there

Perhaps somebody else can answer this for me.

>see previous answer
>
>> When networked, is there a way for the TT to access my Mac G3's adsl
>connection?
>why? internet on the Mac exists

Since I have no floppy drive in my B&W G3, I need a way to transfer files to the TT, in case my above question regarding the networkability between Mac <-> TT didn't work.

>> What is the largest capacity harddrive that the TT can have internally?
>ask Uwe Seimet for the correct answer

4GB? That is all I need for MIDI files.

>> How many SCSI devices can the TT SCSI controller access?
>8 i think

8? Maybe I should ask Uwe Seimet.

>> What solutions are there for accessing multiple SCSI devices on the TT?
>hook them up and make sure your weird-behaving SCSI devices are last
>
>> Is the TT easy to rackmount? In other words, is the motherboard small
>> enough to mount in a standard rackmount case?
>no, unless you mount it length-in, but that would be a hell of a rack case
>if a key is installed, the whole thing is too wide

I am not talking about taking the TT and sticking it on some rackmount shelf. I am talking about physically removing the electronics from within the TT and rackmounting these (motherboard, I/O ports, PS, etc...) in a rackmount case. Has this been done?

>> Is the TT easily moved into a PC-style case?
>dont waste your money, just put a front-panel power switch on it

PC style cases are cheap. My G3 is in a rackmount already. I have no problem with funds.

>> Thanks in advance.
>hope this helps

It has a bit. But, I still have unanswered questions.
Steven

> to have the same interpretation of that...

I battled with this myself. In the end I simply used the system palette that CAB adheres to. Run CAB while in 256-color mode and then, with an ACC or CPX, look at the system palette: it's comprised of the 16 core colors, followed by the "Web-safe" colors, and then finally by 30 or so "special" colors. These special colors are significant because they compensate for the limitations of the core and Web-safe colors, allowing for more accurate color definitions when remapping an icon or background image. The key is for the system palette to have the broadest spectrum of colors available.

If your system palette is matched with CAB's, there'll be no palette swapping when alternating between the desktop, especially important if you're using icons and a background image with more than the 16 core colors. Jinnee users won't experience this because the system palette is integrated.

I did a number of remapping tests with 24-bit scans, reducing them to 8-bit XIMGs using CAB's palette as a template: the results were very good, especially since the "special" colors added immeasurably to the quality of the reductions (notably grey tones).

GrafTool (http://ourworld.compuserve.com/homepages/JJvB/) has all the tools for doing the things mentioned here. Note that during the reductions, a parameter can be set that will protect the 16 core AES colors (the only real standard that must be adhered to when creating desktop backgrounds).

I think there's a standard 256-color Atari palette, but it's not used so much anymore with the latest OS add-ons. By standard I mean what the Falcon uses out-of-the-box. When creating background images remapped to your system palette, it's important to know what palette you're running in the first place. This could depend on a number of things (both hardware and software). In any case, the system palette of your choice can be remapped and saved as your default.

As mentioned, CAB uses the same system palette as Jinnee, so one may as well stick to this so-called ASH standard (which has some thought behind it). To do this, run CAB and summon your color ACC or CPX, then save the new palette as your system default. GrafTool (or whatever) can now be used to remap images to the system palette.

The same applies to creating 256-color icons with IconsCon. Once scaled down to the size required (with a graphics program), the image can be saved and then imported into GrafTool. From here it's remapped to the system palette, saved as 8-bit XIMG, then imported into IconsCon. Because the palette of the XIMG is exactly that of the system, importation is pixel-perfect.

4243. Why EMULATORS and CRACKS are Better than a REAL ST

Newsgroup: comp.sys.atari.st
Date: 1999-12-20 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <_lg74.62$a91.217@198.235.216.4>
Source record: 68547

I am posting this in FRUSTRATION. After reading this you will realize that my world will not come to an end as I know it. The following is not a life and death situation, nor is it relevant to computing but only to game playing.

I have an original game called RVF RACER for the ATARI ST. This wonderfull game was marketed in 1989 by Microplay software. On the cover it lists, "Atari 520ST/1040ST/MEGAS" Colour Monitor, Joystick required.

Well I have the following STs that this game works and DOES NOT work on.

520ST 1/2meg ram, TOS 1.0 (Game Works) Many different 354 & 314 drives
520ST 1/2meg ram, TOS 1.0 (Game Works) " "
520ST 1 meg ram, TOS 1.0 (Game Works) " "
520ST 2.5meg ram, TOS 1.0 (Game Doesn't Work) " "
Use Railroad Tycoon 1meg fix, doesn't work.
520STFM .5megram, TOS 1.2 (Game Works)

MegaST2 2meg ram, TOS 1.2 (Game Doesn't Work)
MegaST2 2meg ram TOS 1.4 (Game Doesn't Work)
Railroad 1meg fix, no effect.

1040STe 2meg ram TOS 1.6 (Game Doesn't Work)
Railroad tycoon 1meg fix, allows game to run.

So RVF racer has a VERY HIGH failure rate with Ataris, let alone ones that it claims it will work with on the cover of the box.

So I wanted to hook up a link between 2 STs and play heads up racing. I mean I do have a couple of STs around so why not. I have done the same with STunt Track Racer.

Well it doesn't say in the manual if 1meg is required for this feature to work. So I tried it with my 520STs.

As soon as the link is choosen the link menu appears and the game locks up. Hooking up my 1meg 520ST allows the menu to appear and doesn't appear to lock up until a 1/2meg machine makes its selection.

So I try the 1040STe with the 1meg fix program & the 520ST with the 1meg upgrade. When the railroad Tycoon fix is run the Link is NOT detected between the 2 computers. ARRGGHH!

So, what I need is a stock 1040STF to link with the 520ST with 1meg upgrade. Of all the damn STs I have I don't have the needed combination.

So, I buy a used 1040STF with TOS 1.0 to play this stupid game that I enjoy with my friends when they come over (Yes I have friends). I figure with the above listing of computers and testing of the game, that I can't miss, well WRONG AGAIN.

The Game doesn't even BOOT up on it, let alone test if it will link. Needless, to say I test out many other games that give some of my computers trouble like Falcon 1.0 and sure enough, all other games that should work with an STF work just fine. DOUBLE ARRRGGGHHH!!

Somewhere between copy protection and memory, they have really screwed this game up for me.

Why do I know this? Because I have the Medway version.

The Medway version boots up on EVERY SINGLE ONE OF MY STs. Even My MEGASTes which I didn't even bother to list. Every Ram Combination, every TOS combination. I am really ticked off! Gee, why if I have something that works?

Why? Well, because unless you have the real game you wouldn't know that the crack is very incomplete.

1) There is no Link feature in the crack. Eliminated from the menu.
2) If you progress through the tracks and ability, from Clubman,national to international Status the game will END!!! In the original game if you reach International STatus and win the World Championship, you are allowed to race at Every RaceTrack at the international level against international riders.
3) As me and my Racing buddy friends have been playing this game during the winters for nearly a decade, we have always wanted to link the STs and play head to head against each other at the world level on all tracks.

Of course after owning many STs and trying for years to get this game to WORK on STs let alone LINK, I can see it just isn't in the cards.

So what have PC emulators got to do with this THREAD???

Well, my one friend has never owned an Atari. He has come over to my house to play RVF racer for nearly 10years. (We just line up 7 Ataris using the crack, and race individually on separate screens, seeing who finishes first after 20laps). Anyways this friend buys his first computer ever, a Pentium ugly thing, and gets the Pacifist and RVF racer. In only 2 days a computer inept user has my favourite Atari game working on his PC. And it works VERY GOOD!!! Mind you with the Crack limitations I mentioned Above.

So here I am with a TT and Falcon, which the crack won't work with, and a bunch of STs including a very standard 1040ST that I just purchased, that don't even work with the original game. I also know that this program will not work with any Atari clones, present or future.

So for something as ridiculous as a game, it really makes you wonder why emulation supports ST games software better than the REAL DEAL.

I am really ticked off. At least I got a 60Meg hd and 2 more monitors for my $40.cdn along with that 1040ST.

Is this whining enough:-).

Anyways, I am starting to have far to large a collection of STs, and I don't even know how I got some many in just 2 years. I only had a 520ST with 2.5meg ram up until 1 year ago:-).

Later Brian.

Cubase yes Notator no Logic yes

> Would they run in ST or TT mode (if there is such a thing)?
Cubase and Logic run in TT-medium using VGA or TT-high using Atari monitor
Notator wont run period

> Would they use TT or ST RAM?
ST

> What is the maximum TT RAM expansion?
8 megs, but there are some 3rd party cards that go to 32M and beyond
you dont need to expand a 4-meg machine to run Cubase

> What is the maximum ST RAM expansion?
4meg and 3rd party cards (i think)

> What kind of SIMMs (if at all) does the TT use?
i dont know
dont waste your money on the TT, just get it up to 4 megs

> Does C-Lab's Unitor2/ExPort MIDI expansion interface work with the TT?
not with Cubase, and not with Notator, since notator wont run on a TT at all
Unitor2 works great with Logic

> Does Steinberg's MIDIEx work with the TT?
yes, with Cubase, and so does the SMP-24/II
not with Logic

I run both Midex+ and SMP-II
Dont think about syncing Cubase CBX/Audio Falcon to SMPTE with Midex+, it
will crash
you must use SMP-24/II to sync Cubase CBX/Audio Falcon when using audio
tracks
note that you can run Cubase Audio Falcon on any Atari in midi-only mode,
so if you dont have Cubase yet, look for Cubase Audio Falcon or Cubase Audio
CBX

> becuse the missing JAVA-script.
> Am I right that there is a browser for Atari called
> Arcor which really takes JAVA?

Arcor is a German telephone company (owned by Mannesmann).
Java is not supported by any Atari browser and no, there is no way to
get Java support in CAB. JavaScript is a different thing but again, it
is not supported by CAB. Light of Adamas supports JavaScript.

> If so, is it possible to use it under Magic and with

It sounds like Freeserve allows only 8 password characters and Free-Online
allows more than 8. STinG's SERIAL.CPX has a hard-coded 8 character limit
so if you are using a longer password, it would stand to reason that
Freeserve would connect as it is receiving the alloted number of
characters (8) but Free-Online is still waiting for password characters it
can't receive. My ISP works like that - allowing an unlimited number of
password characters and I experienced the same problem you are. Change
your password to Free-Online to a maximum 8 characters and see if that
helps.

On 19 Dec 1999, William Robinson wrote:

Trying to connect to ISP free-online, my guns running out.
I connect successfully to Freeserve :)
Tried many different combinations of the Dialer SCR, the best I can get
is to where the modem displays Initialising Link, but then times out.

Mr. Robinson:

Run, don't walk, to the Toronto Atari Federation. They meet on the third Wednesday of the month in the North York Community Centre (Subway stop puts you right there; it's the same building as the Library) meetings start at 7PM. Club officers Ken Macdonald and Dan Dreibelbis may know of a Mega 2 or 1040 STe coming up for sale or trade. They have a library of software with the latest versions of STiNG, CAB and whatnot.

They have a website out there somewhere, but I forget the exact co-ordinates. Somebody else, if you know it, follow up.

Did my bit.

Assuming you're in Europe, you will connect it to the antenna port on
your TV, or you can build a SCART cable. If you're in the US, my
understanding is that most TV's now only have S-video or RCA video
inputs.

Actually, Atari released a 8Mb ST-RAM card. The TT has only 2Mb TT RAM
unless it's expanded.

>> What kind of SIMMs (if at all) does the TT use?
> i dont know
> dont waste your money on the TT, just get it up to 4 megs

It's possible that you can use 30-pin SIMMs (1Mb and 4Mb) on some original
TT-RAM card. The ones I've seen use SIPs though. Aixit's TT-RAM (aixTT)
use standard (and now very expensive) 72-pin SIMMs.

>> What is the largest capacity harddrive that the TT can have internally?
> ask Uwe Seimet for the correct answer

Given the correct driver (i.e. a late version of HD-Driver) I don't think
there are any limits. You'll probably need MiNT or MagiC to use the really
big ones though, as TOS doesn't support more than 14 partitions and
partitions larger than 512Kb (or was it 1Gb?).

>> How many SCSI devices can the TT SCSI controller access?
> 8 i think

7.

>> Is the TT easy to rackmount? In other words, is the motherboard small
>> enough to mount in a standard rackmount case?
> no, unless you mount it length-in, but that would be a hell of a rack case
> if a key is installed, the whole thing is too wide

The motherboard is small enough to fit in a 19" rackmount case, but you
need to hack the ROM-port (desolder it, straighten the pins and resolder
it) to fit any dongles. The same applies to the other ports on the left
(MIDI and keyboard).

>> Is the TT easily moved into a PC-style case?

Yes. The TT has the same PSU as older PCs (AT), so if you still can find
an AT-tower (it has to be tall!) you only need a drill and some screws to
mount the motherboard. Oh, and a soldering-iron to make the
port-extensions.

In article <s_roth-19129914273300001@spc-isp-osh-uas-04-40.sprint.ca> you wrote:
: Would they run in ST or TT mode (if there is such a thing)?

I am not aware of such a thing.

: Would they use TT or ST RAM?

Software normally can run in either ST- or TT-RAM but I don't know about
Cubase etc. specifically.

: What is the maximum TT RAM expansion?

Depending on what Atari or third party card is used the limit might be 16
megabytes to hundreds of megabytes; but theoretically any amount of RAM
may be attached up to a few gigabytes.

: What is the maximum ST RAM expansion?

I believe the maximum amount of ST-RAM that can be fitted with existing
hardware is a total of 10 megabytes.

: What kind of SIMMs (if at all) does the TT use?

That depends on what kind of memory card you have. I have a AixTT card
that uses 72 pin SIMMs. Others are available that use 30 pin SIMMs. Who
knows whether someone has made a board that accepts DIMMs.

: Is the TT networkable to a Macintosh G3? How is this accomplished? What
: protocal is used?

Presumably ethernet would be the easiest; there are some VMEbus ethernet
cards available with drivers for the TT. You could also use the serial
ports if speed was not so important. Right now I am working on a SCSI to
ethernet adapter that would work on the TT.

: What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?

Well 10 megabit ethernet would give you 10 megabits (the actual throughput
achieved with ethernet drops from this optimum figure when more than one
host is using the network). Serial ports go up to 230.4 kilobits per
second.

: When networked, is there a way for the TT to access my Mac G3's adsl
connection?

I suppose that the Macintosh can be configured to forward datagrams
between the Mac-TT link and the Mac-ADSL link (i.e. configured as a
gateway). I do not know about ADSL, but if the connection is ethernet then

it may be easier to attach it directly to the TT rather than via a Macintosh.

: What is the largest capacity harddrive that the TT can have internally?

There is no real limit.

: How many SCSI devices can the TT SCSI controller access?

Like any SCSI controller, 7 devices apart from the controller itself.

: What solutions are there for accessing multiple SCSI devices on the TT?

Just connect multiple SCSI devices using cables in the same way as with any other SCSI system.

: Is the TT easily moved into a PC-style case?

I think it could fit in a tower case, but I have not tried it myself.

I am not familiar with your music-related questions so I have left these un-answered.

Neither did I! But the latest version of Cubase is Cubase Audio Falcon,
which runs on any Atari (>1meg). CAF 2.06 is the version to get, although
Cubase Score is nice too.

> All I want the TT to do is MIDI. That's all! I'm sick of the

> horrible automation that Logic Audio provides.
Pardon? What about the timing of midi on the Mac? Why not get another
cheaper Mac
that allows you multiple screens, current versions, etc? Even an iMac would
work
And they are bloody cheap
I use Logic for all my automation, with Cubase as the main sequencer
Call me crazy

> PC style cases are cheap. My G3 is in a rackmount already.
Please tell us how you rackmounted your G3. Did you do it yourself?

> I have no problem with funds.
I have an SMP-II for sale.

256MB using two 128MB PS/2-SIMMs and a MagnumTT expansion card.

>What is the maximum ST RAM expansion?

10MB (2 on board + 8 on expansion card).

>What kind of SIMMs (if at all) does the TT use?

On board: None. TT-RAM expansion cards take 30-pin or PS/2, depending on how
old the card is.

>Is the TT networkable to a Macintosh G3? How is this accomplished? What
>protocal is used?

Using a VME Ethernet card and MiNTNet: yes. Not sure if your music software
runs under MiNT.

>What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?

10MBit-Ethernet has a theoretical maximum of 1250KB/s, and I have seen above
1100KB/s (but not on a TT).

>What is the largest capacity harddrive that the TT can have internally?

Any SCSI harddisk with moderate power requirements should work - I think
there are drives up to 73GB. If that is not enough, you could attach an
external RAID controller or multiple disks ;-)

>How many SCSI devices can the TT SCSI controller access?

Hi John,

All the best of the season.
All I know about on line connection Byte/Baud or what ever rates is
what CAB tells you on the top row, ie when you're loading an acquired
URL you get the running average rate, you get much the same when you
download an image or a file on fttp.

Bob King.

Hi

The time has come to link my Mega STE to my pc's. To cut down a lot of hassle, as time is limited for me at the present, I need to know how and what I need to do to connect it to my network!

I've forgotten what make the card is, but it fits in the internal slot on the Mega STE. I'm using BNC (thin coax).

I have tried briefly with STinG, but it just bombs out:(

So I'd be grateful to know what software I need, STinG, HSmodem etc..., and any info that would be helpful.

If I can get this working it will speed up waffling through the mountains of disks, formerly LAPD PD library, I have around me as it should cut out transferring onto another hard drive or removable media.

Hi Jerry,

I have a 4X CD drive encased in a MegaST 'brick' case, complete with
power supply and a small pre-amp. It has a SCSI 2 Plug attached (I use
it for my Falcon). I now have a Milan with a 24x CD drive, so the Falcon
CD is spare and is your's for ï¿½30 + pp, which will probably be a fair
amount.

Bob King

also at

rking@zetnet.co.uk

ps the SCSI plug pulls off the drive (standard 50 pin block connector).

>> What is the maximum TT RAM expansion?
> 8 megs, but there are some 3rd party cards that go to 32M and beyond
> you dont need to expand a 4-meg machine to run Cubase

Newer TT-RAM cards allow for more RAM. They use PS/2 SIMMs.

>> What is the maximum ST RAM expansion?
> 4meg and 3rd party cards (i think)

With 3rd party cards you can have 10 MB ST-RAM.

>> What kind of SIMMs (if at all) does the TT use?
> i dont know
> dont waste your money on the TT, just get it up to 4 megs

? Weird answer ...
It should be up to oneself to decide how much money to spend on oneï¿½s own TT.

TT-RAM cards:

Mighty Mic: 30 pin SIMMs, up to 32 MB
AIX TT or Magnum TT (not quite sure, which one): PS/2 SIMMs, up to 256 MB(?)

ST-RAM might be more difficult to find. Itï¿½s a comparably huge board you have to exchange.

>> Is the TT networkable to a Macintosh G3? How is this accomplished? What
>> protocal is used?
> dont go there

The TT is the best Atari to do network stuff with. The major problem will be to find an ethernet card. Since the G3 doesnï¿½t come with a serial interface you canï¿½t use the slow null modem connection. There are at least two possiblities, both cards use the VME interface (located behind serial 1 and 2): PAMs Net - drivers for this card are only available when using Mint as OS. The other card is the Riebl. Here you can use STinG under MagiC or PlainTOS with an appropriate driver. Protocol would be TCP/IP. FTP, telnet, e-mail and newsgroup clients as well as a browser(s) are available.

Since the Riebl has BNC and AUI only, you will need a transceiver AUI to twisted pair (and a cross patch TP cable) to connect the two computers.

Your major problem will be to find such a card. They are no longer
manufactured and highly wanted (and comparably expensive).

>> What is the theoretical transfer rate (mbits/sec) of TT <-> Mac
> networking?

Perhaps 2? Even if you use 10BaseT, I donï¿½t think it reaches the maximum
speed (as well as other computers).

>> When networked, is there a way for the TT to access my Mac G3's adsl
> connection?
> why? internet on the Mac exists

I am not too familiar with additional networking soft for the Mac, but I
guess it would be necessary to install something like IP-masquerading on the
Mac. I only know this for Linux. But I guess youï¿½re not too keen on to learn
how to handle a Unix.

>> What is the largest capacity harddrive that the TT can have internally?
> ask Uwe Seimet for the correct answer

Iï¿½ve heard that even 9 GB would do. But you need the newest HDDriver (Uwe
Seimet is the author).

>> How many SCSI devices can the TT SCSI controller access?
> 8 i think

The SCSI controller can address 7 IDs (0-9). If you want to use one for your
computer (usually no. 7), you can hook up 6 additional devices.

>> What solutions are there for accessing multiple SCSI devices on the TT?
> hook them up and make sure your weird-behaving SCSI devices are last

You apply the usual daisy chain principle. Look for proper termination. If
you want to use a lot of external devices, it might be necessary to fiddle a
little bit to motivate the TT to support term power on its SCSI bus. Since
TTs have DB 25 interface, you might need adaptors for newer drives (TTs have
SCSI 1 only). If you look for internal harddisks, donï¿½t use Quantum Fireball
1 GB, the TT cannot boot from it (As additional harddisk it works fine.)

>> Is the TT easily moved into a PC-style case?
> dont waste your money, just put a front-panel power switch on it

I wouldnï¿½t do this either, itï¿½s too much fiddling around. Get one of those
beasts with several plug-ins and a power switch. You just switch it on and
all devices start up at once. It works fine for me. If you donï¿½t want to
have heaps of cases crowding your computer table, get a bigger one for your
external devices.

Regards,

Kerstin

Does anyone have any pointers to information on how to
use the MIDI interface of an ST in assembly? Preferably
documentation, but working source code may also do the trick.
I'm trying to read MIDI input with the (perhaps overly
enthusiastic ;) intention of turning my old ST into a
MIDI-CV interface.

Message-ID: <385E7BD3.235A5388@mrgs.cix.co.uk>
Source record: 68568

Hi Al,

Does the Falcon have a composite video output on the monitor socket? If so is it wired the same as an STe?

I need to know 'cause I'd like to take the video from the Falcon into my digitizer on my Mac so I can use Apex to do titles and stuff for my Mac video program.

I've got one of those mono/colour switch boxes which I used on my STe. I added a sound and composite video output to it so if the Falcon's wired the same way I'm in luck.

Is this a possibility?

Cross-posted to: comp.sys.atari.st,van.forsale

For sale: B&B's MagiC OS (English) version 6.01 for any Atari-branded
TOS computer.

Reason for selling: It pains to realize this now, but as it turns out,
multitasking w/MagiC on my 4MB Falcon is just too crowded and I can't
afford to upgrade to 14MB or what have you..

This is a recent version and it will be possible to upgrade to the
soon-to-be MagiC 7 with this package. Asking $70CDN. (If necessary,
do any currency conversion at http://www.xe.net/ucc/ .)

Inquiries can be directed here, to [macgod@rocketmail.com] or by
phone--(604) 945-2877.

Cheers,
Derek

You really think it's faster and cheaper to read news _online_?

I find the opposite to be true. I use NEWSie to D/L all the new messages in my subscribed groups, then read and reply offline. It really gets the messages fairly quickly, and then I can take my time to browse through and post - without worrying about my ISP cutting me off for lack of activity.

(just my opinion)

I posted this a week or so ago but it never made it to the server, anyway, here it is again:

-=-=-=-=-=-=-=-=-=-=-=-

On 7 Dec 1999 21:14:44 -, Terry May wrote:

>Thanks for your input. I think you're right that I've carried on a bit
>too much at times, and I HAVE tried to scale back my PC-related messages.
>
>If only you could see the messages I DIDN'T write. ;^)
>.

Terry,

I find your point of view quite interesting, especially given the fact that I am contemplating the move to a PC. I too have used Atari products since the 8-bit days, and moved up to an STE, then my current Falcon, which I use daily for any number of things, including Internet, MIDI/music, etc.

My computer choices were almost always based on filling a need. I got an STE because I was really getting into MIDI and electronic music, and that was the best and most affordable way to go at the time. When the STE started limiting what I could do, I considered switching to a MAC or PC, but instead went with the Falcon - mainly because I was able to get it for a great price - but also because the MIDI/digital audio software I wanted to use was at that time, only available on the Falcon.

True, there was a certain amount of "brand loyalty", although I would say it was more like "brand familiarity". It was certainly easier and cheaper to stick with the same basic platform than to completely start from scratch.

But lately, I realize that I am really missing out on a lot of things, particularly with regard to the web/HTML - because I still use the Atari platform.

My current web browser (CAB 2.7), while adequate, is certainly being left behind since it's not fully HTML 4.0 compliant, can't do CSS, or SSL (at least under _my_ chosen operating system, MagiC), Shockwave, Real Audio, _useable_ .MP3 and others. My only real choice here is to wait for some enterprising Atari programmers to eventually fill these holes in the Atari's repertoire (which is certainly possible!), or to move over to another platform.

I've got friends that use MACs, and friends that use PCs. I haven't made up my mind yet, but I'm leaning toward the PC, since it's a bit more affordable, and there is without a doubt more available for it.

And of course there are a lot of things I _don't_ like about the PC and the out of control and bloated Windows, and truly wish that the Atari platform could keep pace, but seeing my roommates's new PC in action, and all the software and multimedia type things he can do (in addition to hearing from new PC / former Atari users like you and Louis Holleman) is making me feel much like I did when I realized the STE was limiting what I could do with digital audio. It's soon going to be time for a change. And given my interest in HTML authoring and a desire to keep on top of new developments in those areas, I'd be unnecessarily limiting myself by staying _only_ with the Atari platform.

However, at this point I feel I will keep my Falcon for MIDI / digital audio, because from what I've seen on the PC, I'm not really missing out on anything. And the cost of doing the same MIDI / digital audio [I now do on the Falcon] on the PC is a bit steep. And to be honest, I'm not convinced the PC is a well suited for MIDI work as the Falcon.

Anyway, that's where I am now. Casually looking at PCs and pondering my computing future. I'll stick with my Atari for now, but that will most likely change next year. And discussions like this will help me make that decision when the time comes.

-Paul

4273. IPRN for MagiC Installation

Newsgroup: comp.sys.atari.st
Date: 1999-12-20 00:00:00 UTC
From: s.barbieri@ukf.net
Message-ID: <385ebf66.0@news2.cluster1.telinco.net>
Source record: 68577

Hi Everyone,

Just in installed iPRN for MagiC BY Peter Missel following the docs
(I hope - as the're in german) and nothing seems to be happening.
I have installed the IPRN.DEV in the MagiC Extension folder but when I
boot up no recognition is output to the screen or when printing,
afterwards have checked the U:\DEV\PRN directory and no installation
message is evident. Am I doing something wrong here? I have seen other
users mention that it works well so I assume I must have! I am using
NVDI 5.03 and MagiC 6.01.

Thanks in advance.

Sean

I don`t know if this is of any help, but I did use my Falcon connected to a vidio recorder to record some animations I had made with PrismPaint and Apex a few years ago (6 years, if I remember correctly). It worked OK. And some of my PC friends didn`t know what to say, they was not abel to do that trick at that time. And that was with a stock 4 Mb Falcon, no accelerator or extra ram. Havn`t tryed that sice then.

cheers

Nicolas,

Thanks for the breakdown, great pieces of information. I unfortunately went straight from developing 'sinclair' machines, straight to PC's, so missed out on the atari, I am only just starting to catch up on this glorious machine.

I will certainly pick up the quickfaq and have a read through.

Regards,
Greg

According to Ronald Andersson, when you move from STinG 1.15 to 1.20 or
1.22, you also have to replace all of the subsidiary programs as well
ie..the related CPX, PRG, APP etc as 1.20 up works differently from
1.15.

There was a time that I wanted to move to the Mac. I liked the underdog role it played, and i had a bit of experience on Macs and pretty much liked them. But over time I decided that if I'm going to leave the Atari platform because it's limited, why move to another limited platform (albeit not as much). And the Mac's future is also uncertain, though it's certainly doing well now. I also don't like the all-in-one cute approach they're taking. In the end I decided to take the huge leap instead of the small step, and I'm really glad I did.

>However, at this point I feel I will keep my Falcon for MIDI / digital
>audio, because from what I've seen on the PC, I'm not really missing out
>on anything. And the cost of doing the same MIDI / digital audio [I now
>do on the Falcon] on the PC is a bit steep. And to be honest, I'm not
>convinced the PC is a well suited for MIDI work as the Falcon.

No idea. I never got into MIDI.

My latest kick on my PC is making my own audio CDs from MP3 files (widely available on the internet). It's a blast getting some old out of print or never in print stuff and putting on CD, and even making your own full color jewel case inserts and disc labels. I'm very happy with the software (Adaptec Ease CD Creator 4 Deluxe) I'm using for this purpose.

>Anyway, that's where I am now. Casually looking at PCs and pondering my
>computing future. I'll stick with my Atari for now, but that will most
>likely change next year. And discussions like this will help me make that
>decision when the time comes.

Thanks for the comments, and keep us posted on what you do.

Yes. Lots of sysex and controller data. But, if the automation fades
were performed in ProTools, then that would bring my RAM requirement down
greatly...and improve resolution to 24-bit!

<snip>

>> All I want the TT to do is MIDI. That's all! I'm sick of the

>> horrible automation that Logic Audio provides.
>Pardon? What about the timing of midi on the Mac? Why not get another
>cheaper Mac
>that allows you multiple screens, current versions, etc? Even an iMac would
>work

Mac MIDI interfaces are serial devices. The MIDI data is sent out one
byte at a time. With the Atari (and specially ExPort) the data is sent
out in parallel.

Have you ever used OMS? I sometimes have to correct for a 20ms delay.

>And they are bloody cheap
>I use Logic for all my automation, with Cubase as the main sequencer
>Call me crazy

You are crazy. For me, Logic's automation and audio is sub-par compared
with ProTools. Steinberg has dropped Cubase TDM.

>> PC style cases are cheap. My G3 is in a rackmount already.
>Please tell us how you rackmounted your G3. Did you do it yourself?

The rack I used is from Marathon Computer:

Grab STinG V1.22 as advised by others, and in one of the config boxes in the dialer set the flag for server assigned addresses. It works well.

>
>I have seen some people here are using Newsie V0.96.
>What is the current status of this version- is it still in
>testing phase, or is it available to public?

Um, Er, I don't know what you are talking about :---------).

I hope that nose resembles Pinochios, but I am sure there is a better way.

I will give you what I know.

1) Current version of NEWsie is .94 as listed on the NEWsie Homepage.
2) .96 is in Beta Testing.

3) I don't know how many beta testers there are, but I am testing the lastest beta release on a TOS 1.0 520ST with 2.5Meg of Ram, as well as Magic 4.0. I also have a Falcon Geneva set-up and TT Magic, Geneva setup as well as a Number of MegaSTes etc., However I don't consider myself and expert, but more of a bumbler, which is why I sometimes stumble into problems a power user wouldn't. Therefore many users here actually know more about NEWsie than I do.

I am still trying to figure out how to launch a URL from NEWSGROUP POSTS into CAB. Heck I would just like to get the post into HTML for NEWsies own webbrowser, just to jump to the URL. This is an old feature, and there is something in the docs about doing this, but I think the longer I use my Atari, the less I am able to read:-). I must improve my habits.

4) When the .96 version is released, if it is released, I am certain it will be well received. There is lots new, and I am sure we will still want more:-). Keep your eyes posted, for when John releases the final .96.

Actually, I hope he releases it in 2000 to be the first software release of the NEW MILLENIUM. I need software with a y2k Date on my 1985 ST. Who would have thought:-).

I would like to post a list of WHATS NEW, but I think this should all be left to John, when he is ready.

Like I said, I don't actually consider
myself a beta tester as much as I consider myself a user with beta software, hoping to get lucky and find something wrong by being

incompetent. I am certain, John wonders, "why would he have done this? It doesn't make sense" such as trying to open an FTP window and click a url while offline, only to see NEWsie crash. This has little value to anyone, but I did it in an earlier version of NEWsie and John made NEWsie a little more idiot proof when he released version .94, which I consider to be a very solid version.

So yes, it has been a year since .94 was released, and I myself had wondered, if there was to be a .96 or later. I have used this for roughly 2 weeks which isn't alot of time to experiment however I hope NEWsie users see the next version soon.

I hope this helps.

Later Brian.

Depends on how simple. I have never had any problem printing from
any text editor (STeno, EditPlus, Everest, Edith, etc) directly to
my HP500C DeskJet. But if you want text effects (bold, underline,
italics) and a little fancier formatting, give Marcel a try.
Freeware. At an ftp site near you.

>
> Does Cubase or Notator (original or Logic) work with the TT?

Yes, except Cubase 2.0 maybe.

> Would they run in ST or TT mode (if there is such a thing)?

No such thing. They'll run at the TT's max speed.

> Would they use TT or ST RAM?

Dunno, but they should NEED more than 4Mb anyway, so ST Ram is ok.

> What is the maximum TT RAM expansion?

256Mb I think, but not sure. The main question is where to find such an
extension.

> What is the maximum ST RAM expansion?

14Mb.

> What kind of SIMMs (if at all) does the TT use?

It doesn't. It needs Atari RAM boards.

> Does C-Lab's Unitor2/ExPort MIDI expansion interface work with the TT?

Don't see why it shouldn't

> Does Steinberg's MIDIEx work with the TT?

Same here.

> Is the TT networkable to a Macintosh G3? How is this accomplished? What
> protocal is used?

Not really. It probably can be done, but it's not very practical. The TT
has an appletalk serial port. With a TCP/IP stack like STinG you can
probably get started, but this is serial, remember.

> What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?

Serial is 115Kbps.

> When networked, is there a way for the TT to access my Mac G3's adsl connection?

STinG supports IP masquerading. At those speeds though, would the TT
benefit of an ADSL connection ?

> What is the largest capacity harddrive that the TT can have internally?

Several gigs. SCSI of course.

> How many SCSI devices can the TT SCSI controller access?

6.

> What solutions are there for accessing multiple SCSI devices on the TT?

There's a fiddly bit. I beleive it's tricky to mix external SCSI with
internal SCSI.

> Is the TT easy to rackmount? In other words, is the motherboard small
> enough to mount in a standard rackmount case?

Dunno. You would have to measure it.

> Is the TT easily moved into a PC-style case?

Dunno, it would probably have to a big tower.

You have to admit that if your going to purchase hardware that will be
outdated in a couple of years, the new G4's don't look that bad. I
guess it depends if you want to assemble a computer or not. I am kind
of sorry about purchasing a Compaq PII450 at work, to much of a
proprietary effort went into the machine. I have been told that Dell and
Gateway are much better machines to get along with. To much Atari in
me, I would rather build it piece by piece, or let Apple do it for me.
I don't know all that much about new hardware, but as the Commander
(NAVAIR) has ordered no new Apple purchases, I am stuck with a PC at
work. It's their money (or the tax payers, however you want to look at it).
The Reality Monsters are more fun anyway ;).

>(Adaptec Ease CD Creator 4 Deluxe) I'm using for this purpose.

Amazing, that is one of the reasons I love my Falcon :) (Yamaha CDR,
CD Writer and CD Recorder work fine). It's kind of cool to put old
LP's onto your own CD's. No cable modem here, so off the LP is easier,
but you have to be able to record and edit audio......
My kid (yea, he has his own Falcon) have been recording some weird
Japanese Punk Rock stuff only available on LP's. It's pretty funny.
He was using the Expose video capture device on my machine the other
day, posing himself so the picture could easily be merged with some of
the anime he has been playing with. Between Photoline and Rainbow
Multimedia, he has come up with some nice inserts off the Epson Photo
EX. I'm going to get him a digital camera for his birthday and the
Atari software package to download from the camera to his Falcon.
Can't image what he will come up with then.
Guess we do have something in common, even using different machines.

> Does Cubase or Notator (original or Logic) work with the TT?

Notator, no. Logic and Cubase, yes.

> Would they use TT or ST RAM?

Probably ST ram, since they are hardware-intensive.

> What is the maximum TT RAM expansion?

Theoricaly, 256 MB, based on the 68030's addressing capabilities.
Atari made a 16 MB card and Aixit 64 and 256 MB.

> What is the maximum ST RAM expansion?

Theoricaly, 14 MB. In practice, the motherboard has 2 B, then
you add Atari's 2 MB or 8 MB n top, for a total of 4 or 10 MB.

> What kind of SIMMs (if at all) does the TT use?

The ST ram card has its ram chips soldered on.

TT ram uses 30-pin FPM or 72-pin SIMMs, depending on which brand.

> Is the TT networkable to a Macintosh G3?

The TT can do TCP/IP, using MiNT-Net or STinG. If the G3 has a
RS422 serial port, you could use a Mac printer cable as a
nullmodem.

> What is the theoretical transfer rate (mbits/sec) of TT <-> Mac networking?

230400 bauds on the RS422 port.

> What is the largest capacity harddrive that the TT can have internally?

Assuming you use the standard TOS 3.xx, up to 14 partitions of
512 MB each.

> How many SCSI devices can the TT SCSI controller access?

All devices from ID 0 to 7 are supported.

> Is the TT easily moved into a PC-style case?

Using an old style AT case, yes.

You need to have Cab Loaded. A Multi-tasking system is required.

I have never thought of having Cab launch NEWsie, then the Url redirecting back to CAB.

Regardless, I can't get this feature to react.

Am I to understand that you guys, just read your NEWSposts and if someone has written a URL, you simply shift and click on it and you are launched into Cab?

The only thing I can get html oriented is the help file:-).

Later Brian.

An inexpensive alternative to Atari for browsing the web would be a Mac Quadra 650 or Quadra 800. This gets you a 68040 processor, fairly inexpensive memory upgrading, much faster floppy disk writing, and access to lots of good educational software.

I first bought a Quadra 630 to help homeschooling my son. After bitching about the OS for a few months I came to like it enough to buy one for myself. It took a while to learn the differences between the MANY Macintosh models. If I had it to do over I would get a Quadra 650 or 800 instead of the 630. They have more video modes, more memory slots and are easily upgradeable to a RISC Power Mac motherboard. Either model can be bought for $50 to $150. If you live in a city you might find one in a dumpster.

I'm still regularly using my TT, Mega4 and STs. There are still things I can't find software to do on the Mac. All my business programs are written in dBMAN and will run on anything from an ST to a Falcon. I bought Fox Base for the Mac with the intent of porting over the dBMAN stuff but haven't done it yet. I wish I could find a Mac program that would do everything Edit Plus will do. I don't do MIDI myself, but that would be another reason to keep using Atari. But when it comes to internetting, the Mac wins. I could probably sell my TT for enough to buy two more Quadras but I would lose too much versatility.

I admit to considerable predjudice agains Microsoft. Too many virus problems, too much bloated code, Bill Gates has too much money. I have a couple of IBMs I got for free. I don't like them much. Maybe they would be OK with Linux, I plan to give it a try anyway.

Macs are OK. MagicMac seems to run pretty darn good on a Quadra. I don't have anything but the demo though. Can't see paying more for one program than I paid for the whole computer system. Since I still have a TT I really don't need MagicMac.

Hi, I am looking to buy these original Ultima games on diskettes only, complete in boxes with everything in nice shape, platform does not matter :) Please email me if you have any for sale or I have some Ultima and other items for trade.

UI (1 Book, 1 RefCard, 4 PaperMaps, Bag with 3 Coins)
UIV (Cloth Map, Ankh, 2 Books)
UVII (Cloth Map, Book, Medallion)
UVII Forge of Virtue
UVII-2 Serpent Isle (Cloth Map, Book)
UVII-2 Silver Seed
UIV ankh

Martian Dreams

Also IBM only versions of UI and/or UII complete :)

Thanks,
Tom

The "official" English RSC and supplementary files for GEMGS are on my web site, URL in sig. There's a also a download link to ftp://ftp.lip6.fr

For users who have to pay for telephone calls or online time to their ISP I agree with your point about using GS as a viewer for PDF or PS files. Whilst it's a perfectly valid approach, it's just too slow and it isn't capable of rendering PDF files created using newer versions of Acrobat.

Unless someone is prepared to take on the work of porting the Aladdin source files over to the Atari (and supposing that those files in turn are updated) this is a situation that will worsen over time.

Rgds, Derryck

Derryck,

Could be putting my foot right in it here, writing away from my Atari,
but I think I found the 'official' English RSC for GEMGS to be corrupt,
or at least not acceptable by the main program. I recall that somehow it
had acquired an extra first object in the tree. I use a personally
translated version of the German one. Yet again I could be thinking of
some thing else. I'm getting old :)))

All the best of the season to you and the rest of us retro weirdo's

Bob King.

That's why this kind of work is usually done on at least a Falcon or TT
with FPU. Acceleraters or high end clones highly desirable.

I probably wouldn't go with a Compaq, either, if I had to do it all over
again. But for a first PC, it's not so bad. Next time I'll know a lot more
about what I'm doing.

>Amazing, that is one of the reasons I love my Falcon :) (Yamaha CDR,

Haven't gotten into recording off LPs and tapes yet, but will certainly
cross that path eventually. Even with a cable modem, it takes awhile to
download a full CD off the net, but it's fast enough where you can get a few
at a time.

This is because Newsie looks for "http://" to find URL's to
highlight. Since this doesn't have that, newsie is oblivious.

Oh really?!?!?! That would definitely be something to look out for!
I'm sure it probably wouldn't, but it would be cool if the MacOS
emulator would work on accellerated Falcons, like when (if) Tempest
is released! That would definitely be worth shelling out the money
for!

Hi Paul,
Sounds straight and forward (downloading and replying offline). One of my points to John R. was getting Newsie to stay connected while composing a reply on-line. Never thought to try offline. Are there any hints needed to the offline approach?
John

I've actually made the jump and I'm extremely pleased with my PC and VST/24 setup. It dug a small crater in my finances, but sync is rock solid between midi and audio (even better than on my Falcon!) - and even if I run 20 stereo tracks with the same content at the same time on the same stereo output, there's absolutely no trace of flanging or chorus effects, which was indeed present on my Falcon (which I've been very pleased with for a couple of years). The sync in my PC system is really sample-accurate, like the ads say. A couple of the tricks to reach such results is to optimize the PC, using at least 128MB RAM, avoid anything but Intel PII or PIII, use AGP graphics card, separate HD's for the system and the audio etc. The trick for getting midi in sync with the audio is to use a dedicated mdi interface and NOT the midi that's built into a soundcard! DON'T ever use SoundBlaster or other cheap cards for the music - they're only useable for games (if you demand a perfect result).
My PC setup can be seen on my website and I must say that now that I have put it together, I'm very pleased - but I'm also glad I didn't make the switch earlier, since I've gained enough information to make the right choises - something I wouldn't have been able to do a year ago. I use an RME Hammerfall soundcard, RME A/D-D/A rack mounted converters, an Opcode midi interface connected to a serial port etc...
Even though I've left the Atari platform, I'll keep a big part of my website dedicated to the Falcon, in order to provide support for all who don't need the extra functions and the extra software that VST boasts...
Everyone's welcome with questions, just like before and I'll always do my best to help. After all, I've been using Atari machines for ages, and as a technician, I've gained much knowledge that I want to spread to

those who are in need of help...

The problem you noticed may be caused by something different. I just mentioned the quality of your newsfeed since I have observed this problem myself. I am not familiar with Newsie so I don't know about problems that are Newsie-specific. I don't know whether the problem you mention is in fact well-known or not, and my suggestion may or may not have anything to do with the problem. It is just another idea to consider.

The facts are that you need to be running a multi-tasking system to have CAB take a URL from NEWSie in the way that you describe - however the manual for NEWSie goes on to mention that it's possible to copy a URL to the Clipboard for later pasting into CAB's "Open URL" line. I can confirm that both approaches work well.

I think it is safe to say that you are not alone in expressing this
sentiment and as you also mention even some of the most highly pro-active
Atari users use the Mac or PC these days. I feel roughly the same as
yourself here but when I eventually get a PC/Mac one thing I will not
forget is all the help and friendly advice I have received since being
online with my STfm and also the fact that funnily enough I actually really
enjoy using my Atari even with all it's (and my) limitations.

Best Wishes
Sean

The Dialer in the new STinG 1.20/22 version should *not* be usd as an ACC. It should be kept as an APP and is probably best kept on your desktop somewhere for easy access. I had a similar problem when I first installed the new version when I mistakenly used it as you have but now is fine as an application.

Best Wishes
Sean

> nameerf@flash.net

Hi Folks,

I have no problems printing Web Pages containing Graphics (Images).

Before upgrading some of my software/hardware my working setup was
the following...
Atari Falcon running latest Geneva/NeoDesk, STinG, CAB 2.7, SpeedoGDOS
version 4.1, HP DeskJet 540.

With the above setup I had no problems printing out the Web Page that
I was viewing in CAB 2.7 including GRAPHICS while Online or Not!

However one problem I ran into was getting the Borders set correctly
in CAB 2.7's Printing Dialog Box. After getting those set correctly
no problems at all.

Also, you may have to save the PRINT IMAGES option X'ed then reboot in
order for it to work correctly. Also, I believe the printer needs to be
turned on before booting as well.

Usually I do not have the Print BackGround Images X'ed. Some Web Pages
have a large BackGround Image and it just wastes Ink when Printing those.
Here is my current settings for Printing Web Pages in CAB 2.7.
I have my Borders set for a normal letter sized page. You may have to
change these to fit your Page size and Font size.

IIRC my Font Size is 11 or 12.

Printer: HP DeskJet 540

Borders: Left: 01.0cm White Background (X'ed)
Right: 01.0cm
Top: 01.0cm
Bottom: 02.0cm

Images: (X) Print Images: (X'ed)
( ) BackGround Images: (Not X'ed)
( ) MonoChrome: (Not X'ed)

And I have (Don't Change) selected for the Brightness.

I do believe you have to save your settings then reload or reboot the system before some of the settings will take effect. Not sure on that.

If you have a similar setup and it doesn't work, then try re-installing SpeedoGDOS. That might clear up any problems.

Recently I installed NVDI v.5.01 and ran into a problem printing Web Pages with CAB 2.7. It worked fine when I first installed it, but I messed around with another program that alters the Printer configuration and messed it up. I just had to re-install NVDI (no big deal) and it works excellent once again.

Believe It or Not, WDIALOG.PRG works fine in my Auto Folder with latest Geneva/NeoDesk! And I have never had MAGIC installed. ;)

Hope this helps,
phantomm@kih.net

I have nearly the exact same setup. The only difference is my printer
and my SpeedoGDOS version. I use SpeedoGDOS version 4.0 and have a
Canon BJC-4000 printer instead. I however cannot print images from
CAB or any other NVDI-supporting program. The only program (that uses
GDOS to print) that will print images for me is AtariWorks, and
that's only 2-color bitmapped images, no shades or colors.

>Also, you may have to save the PRINT IMAGES option X'ed then reboot
in
>order for it to work correctly. Also, I believe the printer needs to be
>turned on before booting as well.

That was done. No difference.

>If you have a similar setup and it doesn't work, then try re-installing
>SpeedoGDOS. That might clear up any problems.

I've installed GDOS nummerous times with no change. This must be
either a printer driver issue or a GDOS version issue. I've heard
that there are major differences between 4.0 and 4.1 that could make
a big difference here. So I still say that not every version of
SpeedoGDOS will let you print (at least up to 4.0), and this may very
well be the original poster's problem.

>Believe It or Not, WDIALOG.PRG works fine in my Auto Folder with latest
>Geneva/NeoDesk! And I have never had MAGIC installed. ;)

I've found the same here! Geneva's great, huh? Try using it with Mint
1.15.5 (030 version), Thing 1.27, and Boxkite! It is even faster that
Geneva/Neodesk and supports VFAT 32 long filenames! Great stuff!

The New STING can be used as a accessory but you SHOULD NOT EXIT WITH
THE EXIT BOX, but use the 'Close Gadget' in the uppler LH corner and it
can be used in that fashion.

4332. SERIAL.CPX puzzle?

Newsgroup: comp.sys.atari.st
Date: 1999-12-22 00:00:00 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <3860C0F9.243A35AC@patent.gov.uk>
Source record: 68446

I thought I'd sorted out my Milan port problem, by reconnecting the internal cable to COM3. and making everything MODEM2. However! I find that, using SERIAL.CPX, not the Milan specific one (rejected by everyone I've consulted) to set up the rate to 57600 and saving same, only works for the instant online session. I make the CPX read only, as soon as I've saved it, however, the next time I boot up the port speed is back to 19200. I then have to re-set the rate to 57600 for that session. Consulting the save times of SERIAL.CPX shows that it is updated by the saving but it just does not pass on the saved rate to the next session. I've obviously got something completely wrong, but what?? Does SERIAL.CPX not save the rate after all, oh yes the handshaking setting is also lost.

Puzzled,

Bob King.

I've had a 740 since it came out and have to agree it works well
although _very_ slow with my SFfm(4mb). The speed has improved slightly
with the 5.03 updated NVDI driver and have just purchased iPRN for MagiC
so hopefully will improve a bit more, if so I will let you know.
Glad to see the compatible cartridges are comming down in price as is
was costing a fortune : 22ukp for the Epson black cartridge! which I
find runs out *very* quickly.

Regards
Sean

I'm using an Atari STe 4mb w/ 525mb hard drive. I don't know a whole lot about programming, but trying to learn. I took a class on ANSI C, but I haven't a clue what K&R is....

I have original disks & book for Laser C, but my 3rd disk doesn't work. Maybe someone could help me out?

Thanks guys,
Andy

Well, it's nice, that people in reach country like Canada shares old
computer stuffs for (almost) free.
Actually in my, not too reach and famous (with big minus) country Yugoslavia
is situation similar with prices for old computers and equipment. So I have
now 3 Atari ST's with couple hard disk etc.
Reason for low prices is probably not same as in Canada, but I don't want
talk too much here about it.

>

I didn't know that plane tickets from Europe to Canada are so cheap... And
I don't have place for more Atari in my room. And I don't think that travel
to Canada is trouble :-) .
Maybe here... and high risk ! :-)
Oh, other problem: I need visa to Canada. Will you write warranty for me ?

Cheers, Pera

You are both correct here:

1) MIDI _is_ a serial protocol.

2) Using the Export output expander, it is multiplexed from the
parallel Centronics (to which it connects) to three MIDI OUTs.

Just for completion, the LOG3 follows the same paradigm (parallel
to multiple serial) by connecting to the cartridge port.

>anything that expects to see MIDI - it's always serial.

Yes. I know this. I am referring to how the MIDI data is sent to the multi-port MIDI interface in the first place. On the Mac, when data is passed to a multi-port MIDI interface (such as a Opcode's Studio 4), it is sent out in serial (via the serial port or USB). On the Atari, when a multi-port MIDI interface is used (such as C-Lab's ExPort), it is sent out in parallel (via the 8-bit parallel printer port). When the two are A/B'ed, a noticeable timing difference can be heard amongst critical tracks (such as rhythm tracks and ones that contain large amounts of controller data)!

Unfortunately, there are no PCI-based multi-port MIDI interfaces in the market for the Mac.

Try BeOS. It recycles the best ideas from AmigaOS and TOS, and
can run over standard PC hardware as well.

Ok speaking from experience, about one year ago I had a Falcon for about two years and an STe before that. I traded the Falcon for a PC and have regreted it ever since. About two weeks ago I bought another Falcon, I just got the SCSI cable I needed in the mail yesterday and all I am waiting for now is the VGA adapter. I can't wait to get it up and running and dive back into the scene! Anyway, enough about me, good luck with your choices. Peace!!

Martin, do you actually have BeOS? I keep watching it and looking at what I've got. Unlike Linux, which seems to work on most any peecee (and many Macs, even Ataris anymore), Be only seems to accommodate older PPC Macs and a small subset of modern peecees. My P133/ATI graphics/AHA1505 SCSI setup doesn't look like it makes the cut, so I have to wait until (a) Be supports more older HW or (b) I can afford (and can stomach) getting newer peecee junk.

Or a PPC Milan appears and Be ports to it! (and is available in the US (grr...))

But I agree, in terms of modern OS, Be is way, WAY up there!

Pricewise, $80 for the OS/"Bible" bundle is a durn sight better deal than windolts, and compares well to the larger Linux distributions.

Hi Bob

Easy one this, but it took a while to find the culprit. For some strange
and unknown reason, the Serial.cpx doesn't save the configs under
ZCONTROL use another instead and save the configs then you can go back
to using ZCONTROL.

Andy, what rig have you got? I understand gcc is big, even too big for the typical ST. I have been using Sozobon (and the cut-down version Heat & Serve for smaller (even floppy-only) systems), and it delivers pretty well. Don't know if it is still supported (unless the Germans are doing it), but it is also free!

Sozobon is ANSI. Do I understand that MWC is only K&R compliant?

Hi Jorgen,

and all the best.

I had a suspicion that ZCONTROL was at the bottom of it. With some
CPX's, I got drop outs from ZCONTROL at times with very strange error
messages. I think I will go back to good old XCONTROL and see. Also,
when SERIAL.CPX is made read only you'd expect an error message when you
try to save again, but no. I will compare my SERIAL.CPX's using EGALE,
just for curiosity to see if and where the baud rates and handshaking
data are stored.

If it has midi good chance it is Multitimbral(at least 4 part) so if you hook it to your Atari(presuming you have one since you posted to this list)It will give you some tracks to work with on yoyr sequencer.It MAY not be General Midi, but look for the GM logo and if it is there, then you are in Luck! $65 for another tone module is not too bad!

> like it very much.

I am not sure yet, I did some beta testing on it and found it slightly sluggish, though I am sure newer more powerful machines will compensate for this, as it did for 3.1,95,98 and NT.

As for the choices, NT and W2K, they are very different pieces of software underneath, so the comparison in choice is very different. NT is a far more (<SP3 and >SP5), stable piece of software (inasmuch as MS software can be classified as stable <s>), than 95/98/W2K.

From a development point of view, I have had a couple of problems with Delphi and VB with W2K, but they can be overcome, and I am sure a patch release will cure the current problems. But as always, I will upgrade the size of my harddisk, and update partition magic so I can have all the common OS loaded.

Regards,
Greg

Dear Mr May,

What is the purpose of this message in comp.sys.atari.st?
Could you give a good reason of a general posting instead of keeping it
with _PRIVATE_ email?

Do you have a special reason behind your action?
Would much appreciate if you could stop such threads. The internet and the
general market is 95% PC dominated. I don't think one (you here) needs to
infect the remaining 5%.

Thanks.

4351. CAB Problems

Newsgroup: comp.sys.atari.st
Date: 1999-12-22 00:00:00 UTC
From: jtmartin@gofree.indigo.ie
Message-ID: <Qd984.2039$J9.1370@news.indigo.ie>
Source record: 68465

Hello all,

I have been having some very strange problems with CAB. I am using version 2.7c. I am running on a 14MB C-LAB Falcon MK.X, with MagiC 5.11, NVDI 5.03, STiNG 1.22 and Olivier Booklage's Fast CAB.OVL 5.66

- Firstly, and most strangely, I can no longer send a file as a paramater to CAB on starting. e.g. If I double click on a *.htm file on the desktop, or drag'n'drop a file to the CAB icon, CAB starts, but does not load the page (it does not however load the home page implying that some form of a command line has been received). However, if CAB is running, files can be passed with VASTART and the page loads! Very strange. I have tried reinstalling CAB, running it on a clean system (even on plain TOS only, with the same effect) (It is interesting to note that all of this worked until relatively recently!!!!!)

- Secondly. Has anyone got Cookies working with either Dan Ackerman's or Olivier Booklage's CAB.OVL. I can get cookies working if I use ICONNECT, and the ASH CAB.OVL, but then all my other clients are out the window! The cookies are received and stored in CAB, but when the remote server requests them again, it appears that they are not being sent back.

I am wondering if this might be something to do with the fact that this is versino 2.7c of CAB. I understand the last official version is 2.7e, but have not been able to obtain a copy or upgrade.

Any help on any of the above points would be gratefully appreciated!!!!

Thanks in advance,

Jerry Martin

The Casio CZ 101 was a classic in it's time. It has many features and was recommended as a cheap MIDI keyboard in the early days of the ST. You will probably find it a bit lacking now and would want better voices and one that can play more notes at once.

You would be far better buying a modern Yamaha which can do far more, and some models have a disk drive so you can transfer files from PC to keyboard easily.

Jerry,
Oliver's OVL does'nt work for me. I use Dan's version 1.301, CAB 2.7,
Sting 1.22, Dialer 1.16 on a Falcon MKI (14 meg) single tos and all works
well. Note: must use HSMODEM7 (not 6) and all the latest STX files (no
mixing).

Erm, I think the word PC (like the word Windows, or for that matter
even the word MagiC) works like a virus to some people. SOME people.
Most of us (Atarians?) are keeping eyes open to "the world"....

One might consider a world existing of candles, petroleum lights, even
gas streetpoles and one person in that world speaking of
"electricity", he'd probably got placed onto the funeral pile.

Peaceful coexistence, ever heard of that one, Kellis?

>have really no idea if it is worth checking out.

See www.be.com

Be started out proposing to start From Scratch, with a new platform and a new operating system that would not be subject to the legacy baggage of either the Wintel or Mac platforms. They invented (in the tradition of Medusa and Milan!) a new computer based on a PowerPC called the BeBox that included a number of interesting features, and started work on a new OS. Well, they had to drop the hardware in order to stay focused on the software (would that Apple would consider this seriously), and then, when Apple refused to share technical details of the G3 machines, Be publicly released the Intel port that they had already been working on. They support both peecee and older PPC-based Macs. You can look at the Hardware Requirements FAQ for ideas whether it will run on anything you've got.

Be is really a complete operating system, but to avoid being stomped by MS, they have positioned themselves as a niche OS for "digital media." Since BeOS is a totally new proposition, they can build much closer to the hardware than was previously possible, with correspondingly improved performance for especially video. The premise behind BeOS is "massively multithreading", so you can get an idea of what developers might be interested in!

I have never seen it in action, but the promise of a clean, new, modern OS is very enticing! The fact that it runs on non-Intel hardware is all the more exciting!

Fine for Sozobon. Someone else will have to tell you whether gcc is a
possibility.

K&R - Kernighan and Richie (sp?), older-style syntax: "Antique"
ANSI - "Official", industrial-strength: "Modern"

Both gcc and Sozobon (and H&S) are available on Atari FTP sites.
Pull both down (or one first), look them over, try one out.
Reading the docs on Sozobon is an education in programming
all its own.

I suggest looking at http://www.be.com with a good browser.
The screenshots and specs are enough to make one orgasm.

Of course, as noted by someone else in this thread, not all PC
and Mac hardware is supported yet, but if someone does their
homework right and ensures that the hardware they intend upon
using is already supported (changing graphics card or other bits
to adapt their kit, if necessary) this is a great OS.

Newsie handles e-mail, news and ftp, and it seems that it does so quite
reliably. It also has an elementary web-browser (though I still have
to succeed doing anything useful with it). Maybe Newsie should be
considered as an embryo for a future all-in-one Internet application,
now that CAB is no longer developed and Wensuite and Draconis seem to
have all sorts of problems. With a development in handling HTML,
some rearranging (I think that the positions of miscellaneous functions
in menus are a little chaotic) and a little estethic make-up,
maybe some Newsie 1.99 will be...

I know that it requires a lot of work and time that the author probably
has limited amounts of, so this is just wishful thinking...

Cu.

Of course, Ataris were built with MIDI in mind; PCs, for the most part,
weren't. Atari was smart to grab that niche market.

I haven't had time to really look over the specs, but what about the screen shots did you find so appealing? Not that they look bad, mind you, but I don't see anything there particularly special. Looks pretty much like GEM/Mac/Windows, only with slightly different clothes Didn't even get my tongue hard. ;^).

FYI.
I rarely reply in both email and newsgroup at same time.
But here was necessary, as it was a thread plus it directly concerned you,
and as you know when talking about someone, it is not good practice to
talk about them and them not knowing it you did. (confusing isn't it?)
I made sure you did read my post.

> Do you single out every single message that strays off-topic, are is your
> crusade limited to me and/or anything PC-related?

Pretty much yes. As everything I do is atari related. My internet
connection I pay every month is for atari, news, web, programs, software
updates and all. Is that wrong?

What I just see being wrong really is: a pc users preaching for his
machine on a non-related platform which is defined basically as
anti-normalization(atari/amiga and such). And then this very same pc dude
would get offended by someone (me here) booting him off.
That's where I don't get it.

Straying for a short while is ok, which would answer the fact that I am
not like an hawk, watching for anything happening, then attack.

blah, whoever started the thread, as said above it is not forbiden, just
the way the conversation goes. The way you lead it with one apparent goal.
"No mom, I swear, I didn't do anything, he started first..."
"Why me? that's not fair! he started it!"

Terry, may I ask how old you are?
Nah, after all I don't need no answer, it really doesn't make a
difference, and would only keep this thread going on and on.

It wasn't necessary. If you quote me and reply to me directly in a thread in which I'm participating, not only will I see it, but I'll know it's directed at me.

>> Do you single out every single message that strays off-topic, are is your

>updates and all. Is that wrong?

Yes, it's wrong that you've decided to single me out in your little anti-PC crusade. I don't care what you do with your Internet connection. If a single off-topic post in an on-topic thread sets you off, you have a personal problem. And again, if you're so anti-everything not Atari, why are you even bothering with a thread with "PC Choice" in the subject?

>What I just see being wrong really is: a pc users preaching for his
>machine on a non-related platform which is defined basically as
>anti-normalization(atari/amiga and such). And then this very same pc dude

I have no idea what you mean by booting me off. I don't know where you live, but here that means removing someone. You're not threatening me, are you?

>Straying for a short while is ok, which would answer the fact that I am
>_not_ like an hawk, watching for anything happening, then attack.

Apparently, you are. It was a single off-topic message in an on-topic thread. And yet, you've totally ignored others who have gone on and on about BeOS, as well as those who have discussed Windows NT and Windows 2000. Apparently, this is a personal attack. If you have a problem with me personally, I'm sure your software has filtering, no?

>blah, whoever started the thread, as said above it is not forbiden, just
>the way the conversation goes. The way you lead it with one apparent goal.
>"No mom, I swear, I didn't do anything, he started first..."

>"Why me? that's not fair! he started it!"

Ah, another conspiracy theorist, looking for demons under his bed and in his closet. Trust me, you can take what I say at face value. There is no hidden agenda. As I said previously, I don't care what people use for a computer. Bill Gates does not need my help. I like my PC and I'm not afraid to say it, if it fits the topic, but I'm certainly not trying to recruit anyone to the "dark side."

>Terry, may I ask how old you are?

Geez, don't tell me you're going to the "he has a different opinion, so he must be a kid" card?

Perhaps they should criticize those doing most of the OT posts then. Not
that I personally have a problem with any messages in this thread (other
than the crap from you and Kellis), but if OT posts concern you so much, you
might want to direct your venom at those most deserving.

> There are a number of people here who will / may move on to other

>of different NG's based on M$ products.

Steve, why don't you actually take the time to read the entire thread and
note the author of each message and then get back to me. Clearly you have
just jumped in mid-stream and you don't know what the hell you're talking
about.

Other than wasting everyone's time (mine included) arguing with you and
Kellis, the only off-topic message I posted was in response to someone who
said he uses NT at work but prefers using his Atari at home. I simply asked
him if they were going to upgrade to Windows 2000 where he works. From that
a big thread ensued about NT, W2K and BeOS. I've gone out of my way to stay
out of it, as I promised to do previously, and yet morons like you and
Kellis still jump all over me.

This makes me want to post MORE off-topic stuff here, just to piss you guys
off. I'm going to get blamed for it anyway, so I might as well do it. But
I respect the decent, fair-minded Atarians on here too much, and will
CONTINUE to try and keep my messages on topic.

There are a number of people here who will / may move on to other platforms and OS's and vacate the Atari system. A number of people here already have done so but I think we have to remember the focus of the NG which is the Atari system and it's OS's and software. We can go off on loosely related threads the odd time with it not offending anyone. But when an OT post dominates the postings then it is time to pull the reins in a bit.

Hmm, both the RSC files from my local copy and the one stored on the offline copy of my web page are perfectly OK? The first object in the RSC file is a little box which states that it is V1.2. Is this what you mean? It's the same in the German original.

>Sounds straight and forward (downloading and replying offline). One of my
>points to John R. was getting Newsie to stay connected while composing a
>reply on-line. Never thought to try offline. Are there any hints needed to
>the offline approach?

I have always used the "offline" approach with NEWSie (mainly because my typing is terrible and slow :-) but all I do is read the Article or Email, choose "followup" or "reply" in the options and compose my effort. When finished I save and quit my editor(Everest) and choose send. NEWSie will state unable to connect to host but will queue the article in the offline postbox or out box for emails - you can check what you've written by clicking on the article/email in the normal way, I do this just to check again for cock-ups :-) Then once you have composed all your articles and emails you can connect again then "connect to host" and the articles will be sent to the newsgroup. With the emails you can send queued mail manually or set to "send queued mail at check" in the mail reading options which will do just that when you log on to your mail server.

Incidently the same thing works with URL's if CAB is also loaded and you are still offline. When you see a link you are interested in within an email or article while in NEWSie, hold the left shift button down and click on the link. This will throw the link into CAB and CAB will state "error unable to resolve" etc but if you choose the save to hotlist CAB will save the link for when you are online where you can then access via your hotlist. I find this really useful and it saves time and money.

Hope this helps.

Best wishes
Sean

4376. epson 740!!

Newsgroup: comp.sys.atari.st
Date: 1999-12-22 00:00:00 UTC
From: fried@dragon.achilles.net
Message-ID: <83pehrjpr1@hermes.achilles.net>
Source record: 68533

Hello there, I just got an Epson 740 colour printer, and have been trying
it out, and I can tell you that the NVDI 5.03 drivers work really well.
Printing from Photoline at 1440x720 on glossy paper yields fantastic results.
Atari works, and everest both work well for print, and at 360 dpi in b/w
it is quite sharp. I have the demo (german!) of papyrus and this also seems
to work with the NVDI drivers.
I would really like to see Imagecopy 4.1 with an updated printer driver
for some of these newer printers, or maybe some way of making Imgcopy, use
NVDI for printing. It is such a useful utility, and ofers many features
not found on similar programs on other platforms!
I can actually print with IMGcopy on my 740, but it only seems to work
in 360 dpi (not 720) and not all that well since it doesn't take advantage of the newer
technology.
Anyway thats my little bit of news,
Bye now, Mark

let me concur that as far as quality printing is concerned, the Epson
is tops! I bought a refurbed PhotoStylus for use with both the Quadra and
the Falcon for $167 CDN last summer, and it's proven to be great. Indeed,
I recently printed a JPEG on some special Xerox photo paper a few days ago
at 720x720 and was stunned at how well it turned out. Ken, TAF's
president, recently bought a 640 and has so far also been impressed with
how it works with his Falcon.

How do you find the speed, BTW, I'm finding on the Mac it's pretty
reasonable wheras on the Falcon it's a bit pokey. Have you done any
tweaking within NVDI to get improved output?

Wish I could tell ya for sure which one is the problem.
Not sure if SpeedoGDOS v.4.0 has a driver for that printer.
If it doesn't then I'd say thats more likely the problem.

I bought a SpeedoGDOS version 5 upgrade awhile back and updated my
version 4.1 that came with my Falcon.

I know that Speedo v4.1 doesn't have a driver for the HP 540 deskjet,
but it does for some of the slightly older HP deskjets and I can use any
of them with my HP 540. The 540 will also print in color if you use a
color ink cart.
The main reason I bought the HP 540 some years ago was that most all
Atari DTP/WP software supports some kind of HP DeskJet so finding
a working Printer Driver is no problem.

Also like the Envelope slot for making custom Envelopes using PageStream.

If anyone is looking for a decent printer for DTP/WP work but doesn't
want to invest big bucks for one of the newer laser or etc. Then ya
won't go wrong on a HP DeskJet.
I'd like to find one of the older HP 500's or similar model that uses
those Font cartridges. Anyone have a good working one forsale/trade?

>

>Geneva/Neodesk and supports VFAT 32 long filenames! Great stuff!
>
Yes, I really like Geneva, great compatibility. Some versions of
WDIALOG seem to work better with Geneva than others. I've had no
problems at all with the version I'm using now even with the CT2B. ;)

Gosh, I've been meaning to setup Mint with Geneva for along time now.
I bought (The Complete Atari Mint 1998) CD by Whiteline CD Series, months
ago just never found the time to set it up. Got too many projects and
not enough time. :)

Lately been running NeoDesk as a ACC, I like using it as a ACC better.
Wonder if I could run another DeskTop or 2 along with it? ;)
Can you run Thing as a ACC?

I have a Desktop program here called SLICCTOP. The Manual says it is Multi-Tasking. Has anyone round here used it before? If so is it any good? Also, anyone know what the latest version is and if there were any support programs made for use with it?

Hope you all can get the CAB printing problem worked out.

Heheheh, Atari's can print. Try selecting under options, printer,
printer type, "BIOS". ImageCopy will then use NVDI to print (if that
is the GDOS you have installed).

Mike

Download for offline reading. Reload NEWsies grp file , you can do this by exiting NEWsie and reloading NEWsie or simply select NEW from the group preferences and then when the file selector appears, reload the grp file and all newly downloaded articles will be available for reply. Um, a good hint would be to disconnect the modem connection at some point, no point to replying to offline messages if you are still online now is there:-).

Later Brian.

>who can modify game to work on every Atari (at least ST) version... Or try
>TOS loaders...

Well, actually I did spend what was considered to be alot of money on my Atari back in 1987. Laser Printer and Ram upgrade + massive 20meg hd cost me nearly $1700CDN. My Initial 520ST with Colour Monitor about $750CDN and a monochrome monitor for $175.00.

Then not a penny on my Atari for 5 more years. Then it was just used for Word Processing after 1992 and then given to my nephew to play with.

1997 I decided to use my Atari Again, and in the fall, I ended up hooking it to the internet. Not a penny more spent from that initial purchase. Even the 28800 supra modem was aquired for free.

Of all the STs I listed, I got them all since March of 1999.

I have only paid for a handful of the computers.

$20.cdn for the MegaST2 with 30Meg Hd. +Colour and Mono
$40.cdn for the 1040ST with 60Meg HD. +Colour and Mono.

All the other STs, including 2 MegaSTes4 with 250meg drives and 50meg drives, I have aquired for absolutely no monetary value or trade. Simply given to me. And as you can see, I am now running out of room. But do I ever have some neat midi maze games going on:-). The STs are just a fun hobby.

So as anyone realizes, $40.00 Cdn is about $25US or less, and isn't really alot of anything. Infact I probably good have just taken it for free, but I was in a giving mood for the holiday season.

As for finding someone who could modify the game, what a great idea. What are you doing over christmas, I would be happy to let you modify it:-).

TOS loaders, now there is a good idea, why didn't I think of that. However I have every TOS and ST combination. I can run the game on every ST now with the crack, which in reality is all the Emulator can run, as it too can't run the real complete game either.

Anyways, part of the problem with the commercial version isn't just the TOS as it is the memory configurations.

The posts main intent is to show that back when commercial software houses were supporting the ST, they caused more problems then necessary when invoking copy protection. The crack removes the protection and the game runs on everything. The problem with the 1040ST TOS 1.0 isn't the memory or the TOS but the fact that the disk drive doesn't read past the 79th track. I will be replacing it and problem solved. It is a very old 1040ST.

So Pera, I hope to see you soon. Get that plane ticket ready. All I want is the crack that is complete, with link features and World Champion STatus. I am certain it will be worth the trip. I may even give you one of these STs for your trouble:-).

Later Brian.

Hehehehehehe... <grin> (sorry Terry, it was funny!)

I've been following this "debate/discussion/message thread
for a bit, and I just wanted to add my 2 bits. (no pun was
intended there) <grin>

I love my Atari's. Period. Its a personal choice, and a
matter of philosophy. Call it religion if you like, but its
a hobby to me. A serious hobby, granted...but a hobby still,
none-the-less...

IF every piece of Atari hardware/software in the world were
to suddenly fail this moment, I still could not use anything
that ran Microsoft Windows on it. Doing so would be like turning
my back on everything I've believed in for the last 16+ computing
years. What would I do then? Opensource...yep, Linux on an AMD
powered clone. MiNT has taught me a lot about, and respect for,
this new "revolution"... <smile>

Terry, note that I'm not attacking/critisizing your choice, or
point of view. If you left Atari, went with the popular (I use
that word lightly!) mainstream choice and are happy with it,
then fine. I use NT machines at work (no choice, ugh), and I
can tell you that there is no way I'd rather have them over
my Falcon or TT... ;-)

Face it, we're die-hards. <roflol>

Derryck,

Have now checked my GEMGS setup. Not quite what I wrote, but nearly!!!

The 'Official' English RSC LZH file I got, expanded to give me menu1,
forms2-10, alerts1-9. It loaded into GEMGS, but some of the forms locked
up, the 'output' one eg. It showed version 9.9 in the 'about' form. The
German RSC is form1, menu2, forms3-11, alerts1-9. It showed version 1.2.
This is the one I use, translated into English. I would have attached it
to this 'mail, but my bl...y stupid Compaq/Windows NT refuses to
recognise my Atari/Kobald disc. Yell if you want it.

Bob King.

4388. Re: Terry's PC Choice vs. Atari

Newsgroup: comp.sys.atari.st
Date: 1999-12-22 00:00:00 UTC
From: G T Martin <greg@abmlimited.clara.co.uk>
Message-ID: <Jd284.255$x4.6004@nnrp4.clara.net>
Source record: 68545

I have loved this thread. Here is my two pennys worth, and is a humble opinion only.

I am a PC/Wins developer (mostly comms stuff), and have been since 198(?), can't remember, anyway, I was a sinclair man myself for home use as I loved Z80 assembler so it was a good choice. I moved to theuse of PC's at home because of music and of course my development work ,

The music angle

£400 = Terratec EWS64XL sound card (digital)
£600 = PC I built myself
£400 = Cubase VST for the PC

Which all came to a grand total of total heartache as I battle against the bloated and rather cumbersome WIN32 operating system. Giving me mis-timings, out of synch errors etc, the burden of setting up the correct IRQ's on my card so I don't have hardware flips etc. The fact is, for music anyway, you need a dedicated PC, and use it for nothing else once its tuned up.

Anyway I have finially got it right!!!!. How did I do it? I bought a second hand Atari 1024ST for £60, and plugged the keyboard in, perfect synch and no set up worries <lol>. Such is progress.

The development angle

I love looking at older home base 'micros', it reminds me of a day when developers had hardware limitations, and worked hard to achieve great pieces of software in these limiting circumstances. Its a rather sad reflection of the developer world, that if the software won't fit the machine, then its considered a user limitation, so we force users to change their machine. Its sloopy programming at its worst, and I keep it in mind when ever I write a piece of software.

Andrew Braybrook put Uridium on a Sinclair Spectrum 48k, if Microsoft and many other 'visual' developers were to re-write it, it would probably come with a recommendation of a Pentium P1000, and 100 megs of ram (minimum).

This, I think, is a great shame, imagine the possibilty of the PC, if only developers would take more tiime and care over the software developed, look at the software that was developed for the Commadore, the Atari, and sinclair. If this talent was still utililised in the same way, then your PC would not only fly, it would be hitting light speed, without the need to upgrade every 3 months.

My point is always keep a micro at home, its a stunning reminder of what can be achieved with effort and skill, the atari I think is a great example of this.

Best Regards,
Greg

Reply from Jeremy:

I've been busy at work and haven't really had any time
for reading CIX conferences or Atari programming after work and family
commitments. My problem in updating Imagecopy to work with new printers
was that Epson and other companies stopped providing technical
information. I also found it difficult to get testers for some of the
work I had done, which was based on disassembling PC-driver output for
Canon colour printers.

I can tell you here that when CAB reaches the set limit and starts to
purge data from the cache on it's own, it usually results in a freeze up.

You need to keep jpgd.prg in the auto folder, and then make sure you
have the special jpg.ovl that will call jpgd.prg to decompress.
Otherwise you will see no speed increase at all. I think on Flinny's
page is the special version of the jpg.ovl if you are not sure.

>loading the same page without a Cache built.

I am not sure if this helps any, but I've noticed that on my Falcon,
there are accesses to the Hard Drive as well during Table formatting.
I thought it was probably just loading of fonts that haven't been
used yet, but if your removable isn't where your fonts are loaded...

My drive is a SCSI drive, so it wouldn't be an IDE problem, but a
general drive access thing. Don't know why this doesn't happen on the
TT.

About the speed issue, no doubt the IDE removable drive is slower
than a SCSI hard drive, and since it is being accessed for some
purpose, this would definitely reduce your speed. Also, remember that
for formatting tables, CAB just uses the good old CPU, which is twice
as fast in the TT. Both of these are probably severely affecting the
Falcon's performance. I would move CAB to a hard drive and see if it
speeds up.

Guess you have a Riebl Card... someone should help me here to decide
what type, MEGA ST BUS or VME BUS... don't know what bus the Mega STE
has.

> I have tried briefly with STinG, but it just bombs out:(

Normally Sting should do it, together with a FTP client on your Atari
and an FTP server on another machine.
You should use the latest version of STing (1.20 or 1.21). There you
have an ethernet module. Make sure it is loaded; In this module you
should select the type of card (Riebl for Mega STE). Make all the
appropriate changes in STinG you want (IP-address and so on). Once this
is done you should set your route-file. Normally everything should work
fine then.

To transfer files from your Atari to your PC, you need two things : on
one computer a FTP client, on the other an FTP server. Both clients and
servers are available for each system. I never tried the FTP server on
the Atari, but I think it will work fine.

If you would have any more questions, feel free to contact me.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

(Update: 12/23/99) I've just bought a bunch of ST Software titles from a distributor. Almost ALL of these copies are Brand New copies. By +NEW I mean either Factory Packaging, ShrinkWrapped, UnOpened or UnUsed. I must of received over 60 new Titles. Most of these titles I only have 1 or 2 copies of each. Many of which my competitors don't have. First come, First serve. I've included in this NewsGroup posting the List of ST Software I've added to my catalog. This list is down below past all the rest of the text. In my Software catalogs, NEW Software (As opposed to used.) I have in it's listing "+NEW".

(Update: 12/17/99) I'm calling on my regular and repeat customers for help. This is a slow time of year for me. I've had customers start on orders and either cancel or postpone their order because they needed to use their Money for the Holiday. Regardless, I have bills that are being neglected & debts to pay. That's why I'm counting on my Customers to help me make a living. Currently I have a bunch of new ST Software come in. Both New and used. I just need time to process the new inventory. So keep an eye on my Catalogs to find what's new.

e-mail: atari@benjamin.net

I invite you to call me for better service. My hours are different from most people. You can can call me anytime to leave a message, but if you want to speak to me directly, my hours are (usually) from 6 P.M.-5 A.M. Pacific Standard Time. Also I'm available from 10 P.M. Sunday Night-3 A.M. Early Tuesday Morning. To sell to a Customer, He/She must be able to E-Mail me. Still, I believe a phone call can do the work of 100 E-Mails. Especially if things get bogged down. If you call and I'm not their, please leave a message stating what you want and a phone number that I can call you back at the hours listed above. Pacific Standard Time. Call (503)256-9974, and if you can't call me Today, Call me Tomorrow.

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have

the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit & Atari ST! And remember, if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, January 13th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. We're trying to rebuild our club so we're looking for Atarians who wan't to get involved in supporting other Atarians. If your interested, call Ben at (503)256-9974 and by all means, come to our meetings on the 2nd Thursday of the Month. For more info, surf the Web@

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

You should know I regularly add more Atari stock items to my catalogs and this weekend is no exception. A list of my new ST Software I just added to my Catalog are listed below. In case your wondering why my Catalogs (below) are formatted to 38 Columns. They are made to be compatible with the lowest common denominator. Also known as the Atari 8 Bit. Once the Classic Atari User converts the Carriage Returns to Atari 8 Bit.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

I'm looking for the author of some Atari SoftWare and I could use your
help. He's one of the Authors of FreeZe Dried Terminal, He's the Author
of UBBS and ForeSight BBS Software and his Software Company is called
FreeZe Dried Software. His name is Brian G Hauer. I'm a registered user
of some of His Software. On top of that, I recently sent Him a bunch of
Atari Jaguar Hardware & Games & a 7 CD Changer CD ROM. I was expecting
to receive extra & special support. Instead, soon afterwards He dropped
support of my Software. Now, I'm not asking for a refund or a return of
the extra stuff I sent Him. Still, I would like to receive the support
and special attention I'm entitled to. Brian G Hauer lived/lives in
California. His Parents/Family still do. His parents Phone is in the
(310) area code. Nobody there returns my Phone calls & the only answer
I get is their Answering Machine. Last I heard, Brian was getting His
College/or better Education in California. I'm guessing USC/UCLA. I
would appreciate information such as an E-Mail Address, Phone Number or
even an Address. Please, if someone out their knows Brian or knows His
whereabouts. Please E-Mail me or call me at: (503)256-9974. And Brian,
if your reading this, E-Mail me at: atari@benjamin.net or please call
me!

e-mail: atari@benjamin.net

I'm calling on my regular and repeat customers for help! This is a slow time of year for Atari sales and I. With the Holiday Season upon us, my potential customers aren't thinking about buying Atari. Their busy shopping for Gifts for the season. And this time means slow/no business for me. Bills go unpaid, I borrow money and I'm unable to buy Gifts for my friends and family. Hey, I'm not asking for Charity, no Hand outs. I'm asking for my regular and repeat customers to give me your Atari Business. And if you haven't bought from me before. Try making a small order. Kind of like a Trial Run. See if you like it. And if your unsure about me, these NewsGroups are a good place to start. A lot of my Customers frequent these NewsGroups. So Go ahead & Post here. Ask them about me, Bravo Sierra (Ben Smith) of Bravo Sierra Computers. I'm sure everyone has their own opinion. And those of you with nothing nice to say, well I can't stop you. Also, you can use search engines like Deja News. I don't remember the exact spelling of the Web address. I do remember when I want to get to Deja News, I go through search engine http://www.search.com for a large collection of search engines. When you get to Deja News, search the NewsGroups for Bravo Sierra or Ben Smith and set it so it's farther back than recent. Going back at least a year. You'll find a lot of people have a favourable opinion of me. Some down right loyal. My repeat customers. And for those who have a negative opinion of me? Well everyone is entitled to their opinion.

www.search.com

You should know I regularly add more Atari stock items to my catalogs and this weekend is no exception. A list of my new ST Software I just added to my Catalog are listed below. In case your wondering why my Catalogs (below) are formatted to 38 Columns. They are made to be compatible with the lowest common denominator. Also known as the Atari 8 Bit. Once the Classic Atari User converts the Carriage Returns to Atari 8 Bit.

4409. NEW Meeting Night! Atari Club Meeting in Portland, Oregon. USA!

Newsgroup: comp.sys.atari.st
Date: 1999-12-23 00:00:00 UTC
From: bensmith@user2.teleport.com
Message-ID: <83urqg$n4c$1@user2.teleport.com>
Source record: 68366
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,or.forsale,pdx.forsale,rec.games.video.atari,
Body handling: HTML body converted to readable text

Please direct all replies through E-Mail at bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I don't regularly check NewsGroups.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, January 13th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

I never had a problem with CAB's cache management, either, on my Falcon. At least the disk cache. I didn't have much luck with its memory cache, but (AFAIK) that had more to do with how it was designed, rather than a bug.

Using JPEGD with CAB, I found images loaded roughly the same as Imagecopy and ST-Guide, when those two programs also used the DSP, but not nearly as fast as Black Scorpions' (or is it Brainstorm?) viewer. A definite improvement over the regular JPEG.OVL.

However, it doesn't work with progressive JPEGs (actually, a JPEGD limitation, I believe), and I wasn't willing to accept that tradeoff, considering there's an awful lot of progressive JPEGs on the Internet. I just decided to wait a little longer for the pages to load.

Just as expected. If Imagecopy used NVDI to print then it wouldn't give any
settings for the printer, but would call NVDI's prin dialog instead.

It seems to me that neither the TT nor Falcon have cache, except for what's internal to the 030 chip. Someone correct me if I'm wrong on this. Cab, like Netscape and IE uses a hard drive cache. The only way I have been able to speed this up is to make about a 5MB RAM disk and set the cache to that in the CAB preferences dialog. The table calculating is the worst on any Atari. Can take 5 minutes on an ST, depending on the page you are viewing. TT has Falcon beat in this area because of the 32MHz CPU vs 16 on the Falcon. Don't know if CAB uses the FPU, but if your TT has FPU, and the Falcon not, this could also be a factor. I revved up my Falcon with a 40 MHz CPU and got CAB running about half the speed of Netscape.

Terry hows about putting a lid on it. Take the hint, don't sweat the
details and lets move along. I don't think anyone has a problem with OT
posts until they get out of hand.
There are a number of people here who will / may move on to other
platforms and OS's and vacate the Atari system. A number of people here
already have done so but I think we have to remember the focus of the NG
which is the Atari system and it's OS's and software. We can go off on
loosely related threads the odd time with it not offending anyone. But
when an OT post dominates the postings then it is time to pull the reins
in a bit. Don't take it personally and if you want to discuss the in's
and out's of the PC try the NG's at msnews.microsoft.com. They have a lot
of different NG's based on M$ products.

Steve

On 22 Dec 1999 07:36:54 , Terry May wrote:

->Are you guys going to upgrade to Windows 2000? I've never used NT, but from
->what I gather, you'll like W2K much better. That's what I'm using and I
->like it very much.

TBH, I've not heard our SysAdmin say. We are a very small, rural hospital but they are very progressive for their size. We use NT machines (desktops) at key locations like each dept., and 4 at the Med-Surg nurses station. We have portables using touch-screens that we unlock from docking stations at various points in the hallways. We carry these into the rooms, and "real time" chart as we do procedures on the patients. My understanding is that these keyboard-less portables were over $5000.00 apiece. That adds up very very quickly. <smile>

Last time I talked to our SysAdmin (he works days, and I work nights, so we don't see each other a lot) he told me *confidentially* that he would have much preferred setting up some sort of Linux/Unix based solution to our computing needs, and was his official recommendation. Unfortunately, corporate headquarters insisted he go with NT. I'm surprised at just how slow NT can be.

PS You did hear about Windoze 2000's release date, right? Seems its Feb 17th...Groundhog Day. If (when) it crashes, they go back and beta-test for 6 more weeks. <lol>

you just don't get it. You are ruining my hobby.
Now, you just ignore such thing, there is no respect. Fine. in the name of
your so called freedom, you do whatever you want. You know what the
definition of freedom is, right? you are, yes you Mr Terry May.
Person, let's not go there, I don't even know you, don't know what you
look like, where you live or anything. I can only judge by your actions.
That's all I see and that's all what I am entitled to judge you by.
I just don't get it. I live for my atari, go to work on piece of crap
computers, then go home, I want to enjoy my hobby, can you let some people
have that piece in peace?
I mean, it is not because you have a pc, a mac or whatever that makes you
an asshole, so, just relax. Some (MANY) people have pc and no atari, yet
they respect and shut their mouth shut to let people enjoy what they have.
Some people which I would call AJ (I am sure you recognize yourself if you
read) took a very good approach. And I respect him immensely, eventhough
he doesn't have an atari at home. But 1) he know what the hell he's
talking about (good coder), 2) always for the better of the platform in
his discussion.
AJ, thanks.

Now Terry, just get down to earth and stop being paranoid, ohh all
conspiracy things and all. whatever dude.

> I have no idea what you mean by booting me off. I don't know where you
> live, but here that means removing someone. You're not threatening me, are
> you?
yes, just enjoy whatever you have. Enjoy your pc, enjoy your atari, enjoy
whatever you've got without putting down someone else. Your comments are
just what I can read in magazine advertizment for Microsoft, Do you work
for them? have any shares with them? Are you trying to justify your
new PIII 800Mhz?

>
> Apparently, this is a personal attack. If you have a problem with me

I have an Atari STe for sale 4MB ram and the floppy does NOT work.
Taking offers here in group.

Also have an Atari MEGA ST2 for sale.

Also 2 mono Atari monitors..... please post offers to the group.

Thanks!!!

JoNk

>
> no, I withdraw this original question as I already know.

Kellis:

Get a life. If someone posts opinions differents than yours and they involve other platforms, which happens to piss you off, just ignore them. In this case, _you_ look like the asshole who's got something to proove; they don't, as they are only responding to other people's comments as to why their Atari isn't their main computer nowadays.

Terry, Paul, and the other PC migrators:

Kellis _does_ have a point: this is an _ATARI_ newsgroup; avoid mentioning your non-Atari equipment or activities here. Everybody reading threads requesting info on Ethernet cards, cable-modem or exotic PPP authentications, no Javascript in CAB ... already are aware of the platform's limitations. There is no need to re-state what so many others before have used to justify moving to another platform.

Dinesh, Mattias and other MagicSomething users:

CAB was supported by STiK and MiNT-Net a good 3 years before the iConnect stack came to Sven Kopack's mind. The MiNT-Net version of CAB.OVL has also been supporting SSL since almost 2 years (on version 1.82 and up) and successfully used by sevral people to perform secure online banking and shopping transactions since then; no Javascript required. In a nutshell: Atari future's exists beyond the realms of Oliver Buchmann's lies and bank account; ignoring it only proves your own blatant ignorance of the facts and shows how long you have been out of the picture.

Others:

Sorry if this post pisses you off. Some recent statements from both the MiNT (e.g. Kellis and the SpareMiNTs) and MagiC (Bengy and the Magic Mac) sides of the fence, as well migrators to other platforms (Terry, Paul, Nash & Young), make it seem like their

current platform choice is this planet's only hope and end up making uninformed or blatantly blindfolded statements to boost their choice's validity by putting down other people's choices.

Enough was enough. I _had_ to put things back into perspective. Sorry.

PS: I _do_ agree that MiNT has become too big to run with the full Internet enchilada _and_ GEM on top, on a simple ST; perhaps a TT or Falcon with 8 MB of ram should be considered the minimum for a decent MiNT setup, nowadays.

However, bear in mind that MagiC also takes over 2 MB of ram for itself, which doesn't leave much room for anything else once the desktop is loaded.

So, who's whoming who? Either multi-tasking choices impair a mere ST's chance of surviving. Magic is no better at this than MiNT. Single-tasking is still what an ST does best, to perform at a decent speed (or even task-switching ï¿œ la MROS or Softlink; this is still usable enough).

Perhaps those PC users _do_ have a point when saying that all an ST is good for is MIDI sequencing, nowadays. In fact, some folks in the original thread happen to mention that the day they got themselves an ST again, years after selling theirs, music became fun and ST rhymed with Music again, even beating their expansive PC at its own game (better timing, etc).

Perhaps this could be the all-time best homage anyone could do to the great ST: "Side-by-side, dollar for dollar, an ST is still today's best MIDI sequencing workstation. Kudos to the Tramiels for their brilliant idea of MIDI ports."

Yes a small patch should be fairly easy to do. What you want isa
program that VDI orders the pallette in your Ximg. Not that hard of a
thing to ask for, since if you display an Ximg you have to switch to VDI
order of the colors.

What would be nice is a program that would do these manipulations
of XIMG to ICON format for you. If it was really fancy you could even
have it dither to a system pallete.

I can dream can't I ;)

(cross-posted to comp.sys.atari.st and sfnet.atk.atari)

I'm looking for an STE with Swedish TOS and keyboard (or Finnish
keyboard even - yes, it exists, according to Atari part numbers
... or was it Finnish TOS with Swedish keyboard, I forgot)

Preference is given to machines retrofitted with TOS 2.06 and an
Ajax floppy disk controller. Reply via q-funk(at)pp.fishpool.fi
with your price and details about the machine's running condition.

Kiitos.

If you have window buffers turned on, NEWsie should boot the url into its own browser. I have been testing with this, and it is much faster than waiting for CAB to load the page. Particularly if the URL Sucks:-).

Anyways, this is a single TOS option.

Later Brian.

Actually, I think Bengy has learned something from his post. It was
obviously a foolish quote, that has only taken away from the positive
message he was sending about Magic Developments. And everything else was
reading so well, until that little jab at alternative OS. I guess, Geneva
must be the other crap:-). Not bad crap since I am using it on my Falcon.

Like I just mentioned, it was a foolish quote that Bengy used, that really
didn't add anything, and I am certain he will use his own discretion, and
be the wiser for it.

>Of course, Ataris were built with MIDI in mind; PCs, for the most part,
>weren't. Atari was smart to grab that niche market.

I don't recall PCs being built with computing in mind:-).

Proof 8088, 8086, 286,386,486, and some here could put forth a strong argument that the architechure of the Pentiums is lacking. But I respect the Power these computers have. Luckily ....

I don't recall Windows being built with PCs in Mind:-).

The true Pentium killer.

Of course niche markets are simply that. I have a friend, don't know if I posted this or not earlier, mind fails me once again, and he bought a Pentium based computer to do midi and replace his Atari ST. 7 Months later, he still keeps his ST because, In his opinion, the PC just SUCKS for midi. So now, he does use his PC for the Internet, and remains using his Atari for Midi like he always has.

The Music Store in town, has Atari in their own private studio still, and sell PC based Music, Midi, software and computers to general consumers. The Ataris are their personal computers. Even their business is run on Ataris with Cricit software. I know this because I had to track down the developer of Cricit for them as they were worried if it was Y2K compliant.

PCs haven't been built with computing in mind, just Consuming. They are the consumers computer.

The fact is, the internet is a strong motivator to change platforms, or add another. If the Atari had a featured filled Browser able to do all IE can, then this thread quite possibly would be moot.

I just emailed a web page that ran on JAVA. Luckily CAB can load the source of these pages. I looked at it and thought that it really didn't seem to do much other than forward two Browsers, NAV and IE to another Homepage. Quite

ridiculous really. I as much said so, and first I was given the URL to the homepage, (It was in the code mind you), and secondly, they are correcting the idiocy of there logic, in order to make it more broad based.

My hats off to Impact Marketing.

Terry. good to see that earlier in the the thread you are getting in trouble again and without even trying;-). Merry Xmas.

I too agree, with Djorde comments about the Falcon. We are talking about an old computer. One that was introduced to me in 1992.

I guarrantee Terry's PC will be aborted in under 5 years let alone 7 years:-).

I offer 2 1040STs or 4 520STs your choice in trade for the above.

>Also 2 mono Atari monitors..... please post offers to the group.

I offer 1 Colour Monitor (not working) and 1 Mono (not Working) in trade.

Or if you have a floppy drive to trade me, I will keep my monitors, and
you just have to send me one monochrome monitor.

If you have 4 520STs then, I will keep my monitors, and the floppy drive,
and let you send me the 1040STe.

If you have 2 1040STs, then I will not ask for one of your monochrome
monitors but only both of them. However in order to do this I would require
the MegaST included in the deal.

In a way, I know how you feel. I never intended to cause any of this magic vs mint crap, and being , indirectly, called stupid for my choice of using MagiC really makes me want to continue supporting the OS. I know I just run a page, and what we need are less pages and more programs, right Kellis?

It just seems I have to almost walk on egg shells when Im posting to this group...

Bengy

Yes Brian, and I should have also added this is for Multi-tasking OS,
apologies to single TOS users who may have wasted their time trying this.

Cheers
Sean

No wonder: AFAIK, ZControl still does not flush the CPU cache after loading
a CPX, so it is astonishing that it works at all on a 030. On a 040 or 060
with copyback cache, chances increase that things go wrong.

I have a cable that connects the Falcon to a European SCART-TV.

Looking in the Atari docs:
pin 1 = red
2=green
3=blue
5=gnd
12=comp video/comp sync
13 = hsync
14=vsync
Further more you have to toggle de lines M1 and M1 (19 and 18) for
putting the Falcon in the right video mood.

That's it. It's official.
Thanks to all of you who have been following my postings.

This is the last post I will make on this newsgroup, I am unsubscribing
from all *.atari.* news.

Terry May, gokmase(strange), centek, holleman, qfuxk, Jo vanderberg,
Oliver (from ash magicpc whatever) and all the ones I am missing.

I just hope you guys will be happy about my leaving, and it will probably
give you all the happiness you've ever wished for: a world without kellis.
Finally.
Yes many people got in a "fight" with me, so I guess cheering will be in
order.

I don't expect to hear anything from you guys again.
Have a nice life, bye.

kellis@1999

Nope.

Even MagiC for Atari hardware is incomplete. The resource is
translated in England and includes a UK keyboard map, but doesn't
cover for any other keyboard layout or language. No wonder they
complain they don't sell enough outside Germany...

I think that pretty much goes for any platform. Yeah, there are a few hobbyists, but most computers are built to make money. And you do that by trying to woo the consumer.

>The fact is, the internet is a strong motivator to change platforms, or add >another. If the Atari had a featured filled Browser able to do all IE can, >then this thread quite possibly would be moot.

Agreed. If that were the case, I'd likely still be using my Falcon.

>Terry. good to see that earlier in the the thread you are getting in >trouble again and without even trying;-). Merry Xmas.

Hey, it's better to give than receive, right?

>I too agree, with Djorde comments about the Falcon. We are talking about an >old computer. One that was introduced to me in 1992.

Yep.

>I guarrantee Terry's PC will be aborted in under 5 years let alone 7 >years:-).

You're certainly right, but it will be aborted by choice. It will be no more obsolete than Ataris are now. It just depends on how much you desire to keep up with technology.

Terry I have to apologize to you. Apparently you took my post as an
insinuation of guilt. The post wasn't started by you. And yes I did jump
in part way. My apologies to you. The thread was getting off topic by a
fair bit an although a bit of OT posting is OK by me (and I assume most
others) we should keep this thing on a short leash. My comments came from
admittedly jumping in part way and seeing the Terry May PEE CEE Show. A
number of others were present but you seemed to have the majority of
postings from the point I joined in and forward. No animosity to you
Terry but as I said in the post "don't sweat the details and move along".
I hope top make this my last post on the subject so lets keep focused and
regulate ourselves in relation to this so others don't have to.
And please keep the name calling for the kids in the schoolyard.

Steve

Dang... How'd you guess?!! ;-)

Actually, yes. While the Stacy could somewhat do it, its LCD is
fading away and replacing the PSU and display would probably cost
me more than finding an STE and adding Mario's IDE interface, and
I also need the extra accents present on the STE keyboard (again,
replacing the Stacy's keyboard with matching Swedish TOS would be
rather costly).

Hi again,

Well, it's a US model again. Mega STE, 4MB RAM, OEM 50MB internal HD.
Was asking $350, but it needs work. 3 keys not working: esc, ctrl, and 2
(above the "q"). This is usually a stress fracture in the printed traces
on the keyboard mylar, $29 from Best. Some people have success patching
the break. I could give you $50 off to save me the hassle, or I could
install a new mylar prior to shipping. I don't think this model has the
1.44 upgrade, but I have a spare Ajax and Epson 300 with the Mega STE
faceplate. I would take $100 for both.

4465. Falcon DSP

Newsgroup: comp.sys.atari.st
Date: 1999-12-23 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <R4v84.10554$QQ5.618@198.235.216.4>
Source record: 68441

I have JPGD.DSP in the Auto Folder. Is this required for CABs JPG overlay? Or do they somehow conflict and nullify one another. The reason I ask is that I am not impressed with the speed at which the falcon uncompresses JPG files. My Falcon is STock. I figure either it is not working or I have something not set up properly.

Any help would be appreciated.

Shouldn't the Falcon, uncompress a JPG faster than a TT? So far my Falcon isn't a heck of alot faster than my ST.

Later Brian.

4466. CAB & TABLES

Newsgroup: comp.sys.atari.st
Date: 1999-12-23 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <05v84.10555$QQ5.618@198.235.216.4>
Source record: 68442

Here is another funny thing happening with CAB and my Falcon vs my TT.

My Falcon has 14meg memory, internal 80 IDE, and external 270meg syquest removable. All internet programs and files are on the removable.

When I load a page and it the falcon starts to calculate tables, the Falcon IDE drive starts to flash, acting something like a virtual drive, it flashes and whirs for quite some time. Even with Pages loaded in the CACHE, the Falcon loading then Calculating Tables is being DESTROYED by my TT loading the same page without a Cache built.

The TT has only 6 meg of memory and instantly shows pages in comparison to the Falcon, especially when Tables are involved. THe TT has an internal 250meg scsi drive, and there is no flashing of the drive when calculating tables.

So my question is, just what is going on with the Falcon, that makes it appear to be reading and writing to the IDE, but it isn't.

I have installed CAB on both computers both in the same partitions, although on the TT partiton E is on the same SCSI drive.

Anyhelp to clear my confusion would be appreciated.

I am certain I have confused you:-).

Later Brian.

Sort of. Actually, it's supposed to remove the files accessed the longest
time ago, rather than just the oldest files.

For example, if the very first site you visit is ESPN.COM and you continue
to use that site, when it comes time to purge files from the cache to make
more room, the static ESPN.COM files should stay, even though they're the
oldest in the cache.

This is also the way the memory cache is 'supposed' to work.

> Ahm; this can also be viewed as a praise to the Falcon.

Exactly! I've really liked my Falcon during all the years and I still
think it's a great machine - and extremely cheap if you get a used one
(and much too expensive if you buy a new one...). I made the platform
switch since I wanted more and better functions than what's available in
CAF. The Falcon was an impressive product and it's a shame Atari weren't
able to communicate this fact well enough to get a wider user base among
musicians :(

> If THIS is the machine (128MB/PIII/???MHz/AGP/2xHD) needed to
outperform
> (in this type of application, at lest) an old Atari computer without
> any special add-ons...

The PC machine I described isn't an absolute demand but mostly a general
recommendation to get the most out of VST. To acheive a performance
similar to CAF, a much slower machine can be used since only 8 mono
tracks of audio is available in CAF and the audio bit that puts much
strain on the machine. Midi is a problem because of bad soundcard midi
implementation, timing problems in Windows etc, so a separate midi

interface is a must IMO. You can run both system and audio on the same HD, but different partitions is recommended then, since Windows writes a lot of temporary files etc - so fragmentation would be a problem otherwise.
The Falcon with Cubase Audio is impressive even so. When the Falcon was released, there simply wasn't a PC around that could match the performance in a music environment - if you didn't want to go sky high with your budget. That's "Power without the price"...

Hi,
I found the other day my old and beloved 520 STF in a very bad state
(some fungus growing on it!) anyway, I'd like to have it working and
replace the Floppy disk drive which is completly wrecked by a standart
PC one. I remember once I managed to use a PC drive but the connection
had to be pluged upside down. I tried again the other day and the
floppy disk can't be read. I arrive on the greenish TOS though which is
good , it means that the rest should be Ok.
Please someone help me to know how to replace my floppy disk drive!!

Cheers & Merry Christmas

Guillaume.

You might be having a problem with the disk drive being HD instead of DD.
New disks are HD so the drive is trying to read a HD disk that the ST
expects to be DD. Block up the (extra) hole and try again.
It should be OK as the A drive. If you use a modern drive as a second drive,
you need to turn part of the cable round rather than the old system of using
a switch or jumpers to make it B.
Hope this helps.

>
> Not very cool but real ...

Its silly that CICON's don't have the same VDI order as 16 colour TOS...

Its also frustrating for me, as I have dozens of 32x32 pixel 16 colour
dithered XIMG 'icons' ready to convert to CICON to throw into the
DESKICON.RSC file. The palette in the CICON's is a different order from
the order GEM uses, which is silly...

Can a small patch be written that maps the colours correctly before I
import them into ICDRAW or RSM?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Thanks to Mikey for the tip about IMGcopy. I tried it and it works although at 720 its really slow.
Excellent quality! The settings need a bit of fiddling with to get the right brightness and contrast.
Chris, try changing the settings in IMGcopy, maybe use "Best" instead of normal. (?)
Bye now, Mark

Keep up the good work. Nothing stupid about people's choice of MagiC (or MiNT or whatever if it suits them). What *is* stupid is the way mention of some things sets certain parties off into rabid mode.

> It just seems I have to almost walk on egg shells when Im posting to
this
> group...

Only when there are people around who think that anyone who disagrees with them is "ruining their hobby". Please...

FWIW, here's my tuppenceworth on the subject, and why it's not totally off topic IMHO:

We've hit a point in the evolution of the Atari platform where some people are finding their machines restricting. This is less of a problem for Falcon/TT/clone users, but even they're not immune, I would guess.

Doubtless unintentionally, this thread (or the interesting part of it) has mutated into a discussion of strategies for dealing with the above situation. This is less an advocacy issue, more one of how to move forward. As such I would say it's on-topic, particularly where someone could decide that the grass is really still greener on the Atari side of the fence (eg MIDI), or where someone ends up keeping using their Atari for the things it's good at and gets a different machine for the areas where their Atari is proving deficient. Or where they switch platforms but keep using much of their Atari software via emulation.

I'm not suggesting everyone needs to run two platforms: some will find upgrading to a Falcon/TT/Milan/whatever clone is what would suit them best. However I think this is a real issue for some Atari users and finding out how some people made their choices etc is in that case a useful discussion, and one which will help keep Atari use going rather than people just jumping ship totally. The alternative is that many

people will abandon the platform totally (and take their knowledge and expertise with them), leaving only a hard core of fanatics (around whom you daren't even mention that some other machines might do some things better - largely due to software availability - for fear of being cast into the outer darkness) and people interested in Ataris purely as retro games machines. Sad, IMHO: I'm more interested in ways of keeping the Atari platform alive rather than living in a museum. By platform I mean both hardware and software, but hardware without software is just useless metal and plastic so for me software is the key, irrespective of what hardware you run it on.

Hi John (and all the others),

let's add a few cents more:
I chose Atari somewhere in '87, one of the reasons being MIDI.
I've spent months working with Midi stuff. Ran Cubase on a simple 1
meg ST from floppies and it did suit me fine. One of the very first
other programs I got onto my ST was Flightsim-II (the Sublogic one),
including a lot of scenery disks. Always loved to spend a few hours

with it, outdated as it became later. Mono screen, what the heck...
I also ran some astronomy s/w, same stuff, all in mono but it worked OK.
After some years it appeared there were much more modern flightsims available, to Intelmachines only. Same with astronomy s/w with more features, even colors. Well, so much for that s/w then, I'll stick to Atari.
Few years ago I started Internetting. That's on my TT, equipped with bigger hd's, a 32 bit graphics card and lotsa memory. Fine, no probs. Surfing the web is OK, the browser's a bit slow and displaying gfx is slow too. Who cares? Well, in the end my wallet started to care. My patience too. Running thru' 100 pictures in lotsa colors on my card, the Atari programs all needed quite some time to get them onto the screen. Right, the machine *is* 10 years old.
Comes in replacement. Enter the prices. Enter availability of s/w. Enter "compatibility at work" (who, please who uses software at work on his bosses' computer that's Atari compatible?)
I do design the website for my employer. I do write IT-items in a 2-3 week periodical for the other employees at work, switching from DOS machines to Win systems, switching from WP 6 and Lotus to Word-97, Excel. At the end of the day, transfer some stuff to a floppy, stick it into my pocket and work further on it at home. Easy when you have a PC, it can be done using an Atari but you need to convert/convert/convert.
Gawd, I had a V90 modem hooked on to the TT, but for some reason my Serial-2 won't work. Got limited to 38k then. On the PC it gets connections up to around 50k (depending on the phonelines). Saves me time (=money). Displaying the gfx on webpages is a tiny bit (...) faster than on the TT. Saves me some more money.
For me the PC was a logical follow-up, also because finally at last I can now buy and enjoy that modern flightsim stuff, astronomy stuff, lotsa gimmicks that come with the machine and are maybe just gimmicks, but even then they're sometimes fun.
I still got the TT running now and then. Not for the Internet. You try to work a 24 bit BMP to an 8 bit BMP using MS software. Yep it works, don't ask me about results. I do that on my TT, using Gemview or whatever and my boss stares at me - why can you do that like that???

You buy an encyclopedia on CD-ROM. Right, with some luck you can get it onto the Atari screen. Parts of it. All the interactive stuff: no way, you need specific s/w for that, available for PC and Mac only. Drats, somuch for the CD-ROM. Just an example. There are plenty of these.

OK, Louie, just wait until this Phenix 2x060 sees the lite. Well, then what? Is Propilot, Fly!, Flight Unlimited, even dreadful Flightsimulator-2000 available for it? Or any modern ATC sim? New astronomy s/w? The SETI cruncher? A decent webbrowser perhaps?
The Staroffice package maybe? OK, running Linux from it, some are. Not everything. I'm just talking about s/w that interests me. Others have different lists.

Sure, when your last machine was a 2 meg ST with SM144 monitor, the fully equipped Milan 040 is s-e-n-s-a-t-i-o-n-a-l...
They tell me it's about 4-10 times faster than a cranked up TT. Well, let's see, I need 45 secs for this piccie to display, that'll make it 4 secs on the Milan... not good enough compared to my present Intel. Hit enter and there it is... 0.4 secs? Or 0.04? Don't know, I can't count in millisecs.

Just a few weeks ago I said the same in the Dutch Atari mailinglist. Got eggs, pigshit, you name it thrown at me. Traitor!!!

I'm not saying Microsoft is the best. Or Intel. I'm just saying that an Atari/Hades/Milan/Phenix has limits, at least to some people.
I also just said that a modern Intelmachine has some limits.
I didn't say: run away from Atari/successors. *I* didn't.

But I'm trying not to just have a tunnel-sight. We're on the threshold of 2000... We've also come a long way from candles and gaslights.

I wish Atari successors luck and a long life. I do hope my TT will last for another decade. I'm just not going to replace it with a Milan or Phenix.
I also wish all Atarians merry Xmas and all the best for 2000.
(and this wasn't my last posting in here...)

4483. fax MagiCMac mdm1

Newsgroup: comp.sys.atari.st
Date: 1999-12-24 00:00:00 UTC
From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <11639_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 68302

I would like to receive faxes on my BBS, but no programs work on my MagiCMac on a Quadra800. It seems that the faxreceiver is not able to detect the carrier, and in fact there is no CD signal on the Mac modem port.

Is there any way to take off the CD detection, or find a program that is able to receive faxes ? The modem is USR so FCLASS is 2.0.

I would like to use BFFAX, and possibly get sources, is the author available or are the sources around ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Phantomm,

I've already sold out of the items on your want-list, but do have the following programs still available that may interest you as they are related to the types of software on your list. Let me know. Cost of Priority Mail shipping is INCLUDED in the pricing.

GRAPHICS

- True Paint (True Color Paint Program) - NEW - still in originall shrink wrapped packaging. $12.
- Positive Image, ver. 1.11 (Professional Image Processing and Retouching). $20
- Cyber Sculpt (Manual & Program Disk, no box) $6.
- Photo Show (NEW - still in original shrink wrapped packaging) $5.

MIDI APPLICATIONS:

- Kawai K-1 Editor/Librarian (NEW - still in original shrink wrapped packaging) $6.
- Kawai K4 Editor/Librarian (NEW in original packaging) $6

PROGRAMMING:

- Laser DB (Source-Level and Assembly-level Debugger) - NEW, in original shrink wrapped packaging. $6.
- GFA Mission Control (Productivity Shell Environment) - NEW. in original packaging. $6

Unless there's been a recent update, December 25th (a Christmas present?) is
the latest, greatest version. I don't remember what year, but it should be
the only one with the 12/25 date.

All three use both a disk cache and a RAM cache. Seems to me you'd want to keep your browser's disk cache on your hard drive, so that you don't have to download your often used web pages every time you load CAB. Let it handle recently used pages with its RAM cache. (CAB 2.5 does a much better job in that area than 2.7.)

4487. Milan II and DVD

I just had a look at the specs. for the new Milan II and while it looks promissing, I was wondering, why don`t they mention DVD.

A new computer in the year of 2000 can`t be without this feature?
Everybody else can show movies on the PC or Mac, why can`t the Milan II?

Or am I wrong again?
cheers

Joergen

These negative opinions wouldn't have anything to do with the fact that
you spam the newsgroups with the exact same *three* sequential posts
every week? Oh, sorry, this week must have been a Christmas special as
there were *five*... ;-)

Source record: 68309

HI Hallvard,

>I did get an idea from your posting though, thinking that it *might*
>have something to do with Thing, despite the comments made here that it
>probably isn't.
Aahhh, you finally seen the light...:-)

>SO the culprit does indeed seem to be "Thing", or perhaps some
>conflicting AUTO software or something else.
NO, it's definitely THING...
I had the problems you've described several times under normal MagiC running Magxdesk, Ease and Thing. The only way to get rid of those files/folders is to use Jinnee or a diskeditor like Diskus. But I'm not sure what is going to happen to your Apple HFS partition if you use a diskeditor...

The problem always seems to arise when using certain programs with "strange" installations or that write log files. The last time I noticed this was with WenSuite...Somehow these programs write something in the FAT that contains an illegal character or is longer then 32 characters.

>Then I tried running MagiCMac with the "MagXdesk" desktop and the
>problem reappeared... strange.
Not really, Ease didn't remove the file/folder, it just doesn't display files it can't handle... giving you the (false) impression that they are finally deleted...

This is starting to sound like a sleazy advertisement, but the only "easy" way to get rid of it is using the Jinnee Desktop... I don't know what you call a fortune... but as a ASH Poweruser you can get Jinnee for 49DM, hardly more then the registration fee for THING. If you want peace of mind and a desktop that is programmed in function of MagiC OS, you don't really have an alternative...

Cheers from Belgium

Dennis

Source record: 68310

Hi guys,

>I just hope you guys will be happy about my leaving, and it will probably
>give you all the happiness you've ever wished for: a world without kellis.
>Finally.
>Yes many people got in a "fight" with me, so I guess cheering will be in
>order.

Since it's obvious that Kellis was berzerk when she wrote this, I suggest we take no notice of it...
CSAST without Kellis...:-(, no more discussions, no more fighting, no more looking out for a nasty reply which I just loved... this is probably just one of her tricks to spoil my Xmass ;-)

But just in case it isn't:
I WANT HER BACK !!
SHE BELONGS HERE !!
I MISS HER ALREADY !!

Let's show we care and value her opinions although we might disagree with them at times...
1. lets send her a supporting mail
2. Go to the place2B and ask Kellis back in the top 10 "most wanted"
3. Remember this is an Atari group for Atari hardware & software users
4. Bengy!!, make some room on MagiC Online and start a petition
5. ????

Jo Even Skarstein, Martin Byttebier since she values both your opinions a lot, please try to pull her back over the line...

What the hell is happening with this group? this is already the second long time member that drops out in less then a month, just in case no one has noticed it Jo Vandeweghe (dipching) has silently left us aswell :-(
Come on guys, if you can give your support to someone with a sloppy shareware registering scheme, you MUST do the same for Kellis...

There's more to it then just katherine, this is about OUR newsgroup, 25% of the postings this month didn't have a thing to do with Atari. Why the hell is there an "advocacy" group? Once that an Atarian gets flamed in his/her OWN newsgroup for being an Atari user, surely there's something wrong?

>I just don't get it. I live for my atari, go to work on piece of crap
>computers, then go home, I want to enjoy my hobby, can you let some people
>have that piece in peace?
The above quote was posted by Katherine yesterday, I recognise myself in this, and couldn't have said it any better... for the very first time I actualy agree with something she wrote. Are there any others here that feel

this way?

>It just seems I have to almost walk on egg shells when Im posting to this
>group...
Bengy couldn't have expressed it any better... and this has nothing to do with the MiNT vs MagiC war/battle/discussion.... it's about our right to speak our mind in a newsgroup that is created specially for us and this purpose... having a different opinion/view is human, it broadens ones view, and personally speaking I have learned a lot from these discussions, not a single week passes by without some interesting info...

I value this newsgroup, and the people that are part of it, although most of us will never meet in real life, you're all a part of my life. I spend about an hour a day to this group, this is much more time then my closest friends get, have all of you ever wondered what you would have done without this group? the group itself isn't important it's the people who are part of it. I sometimes wonder if I would still be an Atari user without the Internet and the newsgroups,

I have personal contact with a lot of you here, and I'm convinced it's not only me, we're all helping/supporting each other. Last week a PC user was amazed to see a group like this, we're bloody unique... let's keep it this way.

Tomorrow it's Xmass, according to a lot of people this is the ideal time of year to put aside the differences, let's do it... and at the same time get Katherine back here also... please?

Cheers from Belgium
Dennis

The interface is already there (IDE), "all" it takes is for
someone to write the MPEG decoder. I'm not sure how well
that would work on even a 68060, audio/video (de)compression
is best done with DSP chips. The more advanced software
players on other platforms also perform real-time oversampling
to "enhance" resolution (as good as DVD resolution is, modern
computer monitors can display resolutions far in excess), and
this really drains CPU power.

Since Milan II isn't actually available yet, we'll have to
see if the final choice of graphics card has hardware MPEG
decoding facilities.

It might of been a side effect of a particular kernal beta. Never took
time to track it down, it was much easier to just increase the cache
size and then completely purge it from time to time. I will let it
fill and see what happens since I have updated the kernal here
2 or 3 times since. ;-)

I think being able to read DVD data disks would be nice as they have
large capacity, but viewing movies seems to me to be just some kind
of "Neat-o" factor. If you want to enjoy a movie watching it on your
computer seems rather restrictive. Unless for some reason your
computer screen is larger than your TV set in the living room? ;-)

I miss kellis already.

I wish the groups were more diverse, and really think some
seperate emulator/other sections is needed. I happen to have ONLY Atari's
(yes I'm crazy) and anything not directly Atari related I skip.
Increasingly I skip nearly most of this group.

Why do people who decide to move on feel the need to post long
yadda... yadda... whatever reasons blah... crap? I've seen MANY
people move on, from individuals to companies and they don't owe
me or any one a reason. It happens, it not anyone's fault and some
people just need more.

Why not just move on and tell your friends
in private e-mail you are gone? Why re-hash what all long time Atari
owners already know and deal with on a daily basis?

It's like asking for a fight.

This post is not directed at anyone in particular. I just wish
people would stop and think before posting.

Oh, Merry X-Mas to all real Atari users... ;-)

4496. Cheap ST Games for Sale

Newsgroup: comp.sys.atari.st
Date: 1999-12-24 00:00:00 UTC
From: Oscar Agra <agra@globalnet.co.uk>
Message-ID: <840du6$86s$3@gxsn.com>
Source record: 68315

Atari Games for Sale !!!!!!!

E-mail : oscar@agra.globalnet.co.uk

Work in all ST/STFM/STE Machines.

NOTE : All prices (noted with the symbol #) are in UK pounds
NOTE : All games are original, NOT copies !

** OFFER : Buy #10 pounds worth of gear and get any single game FREE

List of Productivity Software/Hardware : (#7 each + shipping in pound sterling)
---
* STOS Maestro Plus (Hardware Sampling cartridge and software included)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)

* Baal
* Batman
* Deja Vu
* Driller
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Ghouls 'n' Ghosts
* Gods
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II
* King's Quest III
* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Lotus Esprit Turbo Challenge 2
* Magic Pockets
* Midnight Resistance

* Midwinter
* Navy Seals
* Night Breed
* Operation Wolf
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)

* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway
(2)Original Disks, we do not sell pirated software,so don't even ask.

* Alien Syndrome
* Crystals of Arborea
* Hard Drivin'
* Indiana Jones and the Last Crusade (Action Game)
* Oil Mania
* Panza Kick Boxing
* Rock 'n' Roll
* Silk Worm (Boxed but no manual)
* Spitting Image
* Strider
* Trinity
* Trivial Pursuit
* Wrestlemania

4497. Harddrive for ST for sale

Newsgroup: comp.sys.atari.st
Date: 1999-12-24 00:00:00 UTC
From: Oscar Agra <agra@globalnet.co.uk>
Message-ID: <840due$86s$7@gxsn.com>

Hi,

I have a System Solutions Mini harddrive (External) for sale.

Its has 127Mb capacity, includes all drivers, disks, manuals,
the link cable (to connect to ST). Its all boxed and in excellent
condition.

Bargain at 70 UK pounds.

I disagree with that assessment, particularly if you remove all the posts
complaining about the non-Atari messages. Comparing other platforms to
Atari DOES have something to do with Atari.

>there an "advocacy" group? Once that an Atarian gets flamed in his/her OWN
>newsgroup for being an Atari user, surely there's something wrong?

Who was flamed for being an Atari user, and by whom?

>>I just don't get it. I live for my atari, go to work on piece of crap

>this way?

I don't. It's silly. Why would you enter a thread with "PC Choice" in the
subject, knowing that any discussion about PCs bothers you, and then whine
that people are ruining your hobby by discussing PCs? It makes no sense.

>I have personal contact with a lot of you here, and I'm convinced it's not
>only me, we're all helping/supporting each other. Last week a PC user was
>amazed to see a group like this, we're bloody unique... let's keep it this
>way.

I agree that it's a great group (that's why I'm still here). But it would
be even better if EVERYONE was a little more tolerant and not insist that
everyone else conform to their own narrow viewpoints.

I think most people here are very tolerant and open minded, but there are a
few that aren't, and they make a lot of noise, leading to the very off-topic
posts they love to complain about.

Indeed, not immune. Good software can solve some missing
protocols and offer features nobody bothered with before,
but sheer hardware speed is where the results shine, when
unpacking JPEG images, for instance, as Louis outlines.

> I chose Atari somewhere in '87, one of the reasons being MIDI.

> screen.

True and this is becoming an issue here too. One cannot always
surf with images disabled.

> Right, the machine *is* 10 years old.

Mind you, if Atari ever made a 300 MHz TT with 32-bit graphics,
I'm not sure we would be having this discussion. The speed, more
than the age, makes the difference.

> Enter "compatibility at work" (who, please who uses software
> at work on his bosses' computer that's Atari compatible?)

Obviously, we don't have any Word or Excel on Atari.

> I do design the website for my employer. I do write IT-items in
> a 2-3 week periodical for the other employees at work,

Both of which can still be done faster on an Atari, IMHO.
Of course, Javascript and style sheets have to be tested
on other plaforms, though...

> I had a V90 modem hooked on to the TT, but for some reason my
> Serial-2 won't work.

SCC-B is switched to LAN by default, at bootup. You must tell
HS-Modem to use Serial2, instead, in its config.

> Sure, when your last machine was a 2 meg ST with SM144
> monitor, the fully equipped Milan 040 is
> s-e-n-s-a-t-i-o-n-a-l...

Yep and while the hardware is on par with Mac/PC, the software
available on TOS is still the main caveat: currently nearing nil.

> They tell me it's about 4-10 times faster than a cranked up TT. Well,
> let's see, I need 45 secs for this piccie to display, that'll make it
> 4 secs on the Milan... not good enough compared to my present Intel.

Indeed, because the Milan is at a conservative 66 MHz, at best.
Intel stuff nowadays run _much_ faster. It's like comparing a
concorde and a cesna. Both will fly you there, but the concorde
just has more thrust.

Anyhow, a rather good point you made, Louis.

Btw, and a Merry Christmas to everyone too! ;-)

Hi Everyone,

I have been trying to learn more about Atari enviromental variables
and have come to a bit of a dead end. Could anyone recommend a good
book or web site which explains more about this subject. I seem to
remember someone mentioning long ago that there was a really good book
on this but can't remember the title unfortunately.

Thanks in advance and happy Christmas to all.

Best Wishes
Sean

>sometimes!) and makes the FULL thing about 30 times faster (vs. STe)
>and 3-4 times faster (vs. TT)...

Glad you have your figures, here are mine as I am trying to figure out what
is up and why my Falcon doesn't reflect yours.

TT and Falcon, both in same resolution 16 Colour.
Both TT and Falcon are STOCK.
Both are operating in Single TOS.
NO ACCS or AUTO programs running.
GEMVIEW has DSP option Selected in GLOBALS menu.

I have ran these tests numerous times now. What I did notice is Gemview is
very consistant. Fileformats are selected and not scanned for as the Falcon
was constantly 4 seconds slower in searching the HD.

All Picts are JPG TRUE COLOUR as would be found on any Web Page

Picture SIZE Falcon JPGD.PRG TT FALCON no JPGD.PRG

1024*652 1.31.0 sec. 43.7 1:30.3
640*480 20.3 20.9 45.2
297*433 12.8 12.4 28.9

So in Two cases the Falcon is TWICE as fast with JPEGD loaded.
In ONE Case the Falcon beats the TT.
In ONE case the FALCON JUST STRUGGLES with or Without JPGD prg.
Whats up with this, as this is more often the case, there being large JPGs
on the internet.

Notice how the TT is TWICE as fast as the Falcon on the BIG PIC?
ARGH!!!

Now if I can get my Falcon to that speed I would be happy. Over a minute is crazy. And the same speed is apparent with CAB. I will do more testing, and even try the older JPEGDSP.OVL found in the URL mentioned earlier.

Thanks for your input
More would be helpful:-).

Brian.

Not really. The word "advocacy" implies someone is trying to persuade
others either pro or con to use Ataris. Comparing systems is just that,
comparing systems.

I've already said more than once I don't care what people use as a computer.
They should use what makes them happy. So why would I want to go into an
advocacy group, especially when it's already been suggested by the less
mature in the group that what takes place there is far from intelligent
discussion?

I have no desire to get into a name-calling contest with a bunch of kids who
are proud of their new-found vocabulary. I just want to have intelligent
conversation on Atari-related matters, sometimes positive and sometimes
negative. I believe this to be the best place for that.

Well yes,- I guess the Milan II needs some kind of graphic card, with a DSP

chip and audio/vidio in/out, but will that be impossible?

The reason I did mention DVD was mostly to give the Milan crew a hint of
what line somebody is thinking. They (the Milan crew) might already have
had this in mind, I don`t know?

Merry Christmas to all

> The reason I did mention DVD was mostly to give the Milan crew a hint of
> what line somebody is thinking. They (the Milan crew) might already have
> had this in mind, I don`t know?

Hmm, here is a clip from my interview with Milan:

MagiC Online: The Milan has been great for the Atari world. Although it is debatable if in fact the Milan actually converted PC, Macintosh, or Amiga users, there is no question that it has prevented many from leaving our beloved platform. What should we expect from Milan Computers in the future? Will we ever see the Milan take advantage of technologies such as PowerPC (or even multiple 68060's) processors, built in USB, Firewire, or even DVD rom support?

Goukassian: YES YOU WILL! We've been quiet for a while but we have the most incredible news for everyone you could imagine. If everything should work fine, in late autumn/early winter we well have a brand new Milan, called "ATARI Milan" that will have SDRAM, USB, an 060-processor, DVD-Rom support, a big range of (new) software ...
This all will be produced by Motorola and AXRO GmbH in cooperation with Motorola Computersystems and it will be sold in several hundred (computer)-shops (!). This all has been top secret for many month, but there is a range of software developers working on Milan-Software, Games, Hardware-Add-Ons, new grafic card-drivers ...
But the will be possible, if we should achieve to get the name "ATARI" from HASBRO in license. So our brand new Milan 060, probably called "Milan 500", could be the one and only Atari-Successor! Good news, isn't it?

> Merry Christmas to all

Merry Christmas to all from here too!

Bengy

Hi Mike!

I recommend COMA available from the following URLs (I haven't checked
them recently, but get back to me if there is a problem)

http://i.am/Softbaer
http://www.ThePentagon.com/Softbaer

I am using this software on my falcon, however my modem is connected
to the LAN port, which is essentially the same as on a MAC. Therefore
it should work for your. My modem is a USR 56k Message modem. (Coma
even supports the independant Voice/Fax functios of the modem!). The
software is regularly updated, and is very easy to use. Give it a try!

The problem is, no matter how fast the picture is decoded, you're still going to be waiting for CAB to dither it and put it on your screen. I believe that's where the biggest bottleneck is. And that's even in 16-bit color. Probably the only thing you can do about it is buy an accelerator.

GEM-view has options that affect the VDI indices in XIMG, but constant
experimenting has made me conclude that no way can I match the XIMG
with CICON ordering. I think the fall down is changing the XIMG to the
next thing, which in my case is a Winblows .ICO to be imported into
ICDRAW - I HAVE to do that on a Mac unfortunately, so maybe the Mac idea
of Windows system colours is tripe...Windows icons from a Windows machine
seem to load fine!! Even more sadly I haven't found a PC program that can
recognise XIMG files and convert them to .ICO...

> What would be nice is a program that would do these manipulations
> of XIMG to ICON format for you. If it was really fancy you could even
> have it dither to a system pallete.

I can dream too, but unfortunately I couldn't write a program even if my
life depended on it! Drat!! 8^)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> Shouldn't the Falcon, uncompress a JPG faster than a TT? So far my
> Falcon isn't a heck of alot faster than my ST.

JPEGD.PRG is required in the auto folder, and I think CAB_JPEG.OVL is
required for CAB to hook into the decoder.

Having JPEGD in the auto folder is very useful, because not just CAB but
many other programs on the Falcon can use it to boost the speed of JPEG
uncrunching. My (rough) benchmarks on the speed of JPEGD (using GEM-view)
to decode JPEG files on my STe, my Falcon030, and a friends TT, put the
Falcon WAY faster than the TT and STe at decoding JPEG's. The speed of
the Falcon/JPEGD combo is roughly 100 times faster than the STe, and at
least 20 times faster than the TT. Please note that I'm talking about
the DECODING speed, which is just to unpack the picture into raw 24-bit
data. Dithering to 2/4/16/256 colour takes more time again (much more
sometimes!) and makes the FULL thing about 30 times faster (vs. STe)
and 3-4 times faster (vs. TT)...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Message-ID: <3862BCA7.330BCA52@ihug.co.nz>
Source record: 68379

Hi there,

SYNOPSIS:

Subject spends ages uploading HEXEN.WAD on a slow modem, gets
Patrice Mandin's Heretic v0.22. v0.22 doesn't work with the
shareware version of Heretic IWAD. Awaits release of v0.23.
Grabs v0.23, then deletes all files in Heretic directory...

At this point I realised I'd zapped HEXEN.WAD AS WELL as the
older version of Heretic. Bugger I thought, I'll unlharc the
.lzh archive of chkdsk3 I had on another partition and use
the recover file function. Sadly my version of chkdsk3.lzh
is corrupt.

Can someone PLEASE email me a zipped chkdsk3? I cannot be
bothered waiting days to reload the WADfile from the net
and I need a working chkdsk anyhows...until I get it I
will NOT touch the partition my games stuff is on...

Your actions will be extremely appreciated!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

<snip some very good points>

> However, bear in mind that MagiC also takes over 2 MB of ram
> for itself, which doesn't leave much room for anything else
> once the desktop is loaded.

Here's a small correction. Magic doesn't take up over 2Mb on an STE. I've a 4Mb STE and, with Magic 5.11 (I know it's not the latest version) and no other applications loaded, I have 3343Kb free. This means less than 753Kb is used by Magic. Of this 753Kb, 166Kb is taken up by HDDriver for its cache and another 153Kb is taken up by MagXDesk. This bring the memory down to 434Kb. Then there's the screen memory (32Kb) and the system variables (min. 2Kb), bringing the maximum memory Magic uses down to 400Kb.

Adding Spin 0.34, STing 1.22, Xcontrol, HSModem and a few other programs loaded, the free memory drops to 2853Kb which is more than usable.

AFAICT, the only memory Magic consumes is that of MAGIC.RAM (215Kb), MAGX.INF (3Kb in my case) and MAGIC.RSC (164Kb). This is very much less than the 2Mb (381Kb to be exact) that you say it takes up.

> So, who's whoming who? Either multi-tasking choices impair
> a mere ST's chance of surviving. Magic is no better at this
> than MiNT.

Again not quite true. Magic is fully usable on an ST. 2Mb is the minimum required before you can multi-task effectively and 4Mb leaves more than enough free.

Finally, and totally off-topic, Merry Xmas and a happy New Year to everyone.

Chris, thank you for posting Jeremy's response. Its too bad when information is all sealed up by a corporation, such dangerous knowledge about printers!! I wish I could help you with printing from IMGC. I am using a TT with NVDI 5.03 and Magic 6, if you are using Magicmac, I don't know anything about that. After some initial enthusiasm, I have found that the print quality is not always perfect, depending on the picture, and other settings. I think bright pics with lots of colour work better than shadier ones.
Bye now, Mark

Hi Lonny and others

Just to let you know that on my Milan I have never cleared CAB's cache
for the 12 months I've used it. When the cache gets full I just hear
a little spinning from the HD for a couple of seconds and thats it.
No problemo. Come to think of it, it worked on my old STE as well.

4525. 1.44MB Floppy on 1040STE

Newsgroup: comp.sys.atari.st
Date: 1999-12-24 00:00:00 UTC
From: gozer@montana.com
Message-ID: <38631b8a.9382626@news.montana.com>
Source record: 68386

I was troubleshooting the floppy drive on my 1040 STE the other day
after taking it out of the closet, and I found that a wire on it had
come off of the solder point it was connected to. It is an Epson
SMD-340 drive. I got the system from toad computers a few years back.
If anybody has some schematics for the floppy mods they were using,
I'd like to know where this wire needs to go. :/ thanks

Greetings Atari Folks,

Would like to find the following Atari ST/Falcon software/hardware packages.
Willing to purchase or trade Atari software/hardware for them.
The Software must be on original disks with manuals and everything
necessary to run them correctly and error free.
The software and manuals must be in English. I'm looking for the
latest/last versions but may accept earlier versions. Also if a
030/Falcon version was made then thats the one I'm most interested in.
Some of these listed are Falcon only anyway.
If you have any of these and don't want to part with them, I'd appreciate
if you would e-mail me the version number especially if it's the last
version so that I will know what version to ask for.
Also will buy/trade overseas! Here is my want list...

Graphics/Music and etc
1. CHAGALL
2. RAINBOW MULTIMEDIA 2
3. PRISM PAINT 2
4. CHROMA STUDIO 24
5. XENOMORF 2
6. PHOENIX
7. DA's PICTURE
8. TRUE IMAGE
9. SMURF
10. HARLEKIN 3
11. CHRONOS 3D
12. CYBER PAINT
13. RETOUCHE
14. PHOTOLINE
15. ARTWORX and Modules
16. PAPILLION

On the Subject of JPEGD for the Falcon.
There seems to be many different versions of this Auto Folder program.
I never found out for sure which one was the Best/Fastest to use.

If anyone knows, Can you post the version and or File Size/Date please.
Also a URL on where to find it and any other additional info on it would
be helpful.

Future Thanks,
phantomm@kih.net

Hi all,

Thanks for the info. I still haven't sorted out the problem. I have tried both OVL files again, and have experimented with every combination of settings in Oliver's OVL and CAB to no avail! I can't figure out what might be wrong (unless it's down to my version 2.7c of the browser?)

> Not sure what you mean by "web based E-mail" so I can't honestly answer!
As regards this one, IMHO web based email is a waste of time, but services such as http://www.mailexcite.com and http://www.hotmail.com exist which provide you with a free email address and an account you can check from any browser on any computer.

What might be of more use (one I use myself from time to time) is
http://www.webbox.com
This is a free service which allows you to collate and check up to 5 POP3 email accounts via the web, and from any computer. Take your email with you wherever you go!!!

Cheers, and merry xmas!

Hi Robert,

I've sent you some emails but I don't know if you have got them? Since
I've seen you in the newsgroup, I know you will get this one ;-)

Hi,

I'm interested in the CD ROM drive you have. It sounds ideal. Have you any idea
how much P&P would be to Ireland? (Just a pity about the bad Irish/English
exchange rate at the moment... damned Euro! ;-) I will be daisy chaining it
with a ZIP drive which I already have (SCSI ID=6). Do you think there might be
any problems with this config?

How big exactly is the case? I have never seen a MegaST '�n the flesh'! Is it
housed in a case of a former MegaST compuer, or one of the peripherals?

Looking forward to hearing from you,

Jerry Martin

Bob King Wrote:

Hi Jerry,

I have a 4X CD drive encased in a MegaST 'brick' case, complete withpower
supply and a small pre-amp. It has a SCSI 2 Plug attached (I useit for my
Falcon). I now have a Milan with a 24x CD drive, so the FalconCD is spare and
is your's for £30 + pp, which will probably be a fair amount.

As I remember, though, it wasn't 100% compatible with the one on
the MEGA. Also, late-production units have the hatch sealed in
and the connector omitted.

> I have another Stacy inquiry. Was there a STacy made without
> an external monitor connection?

As far as I know, they all have it. It's the usual 13-pin ST
monitor connector.

PHTML means the page uses a server-side scripting language called PHP.
By the sounds of it, CAB got confused with whatever the PHP-enabled
server sent back to the browser (and subsequently to you).

That`s all good news,- next come the question? What is the price tag?
If it is the same or something like the price of a G4 or a Pentium III,
then they really have to come up with some powerful software.

I know we can`t expect to see the price at half that of an IBM - Compaq or
something similar. As long as it didn`t cost more I`m satisfied.

Then,- can they persuade TechnoBox to port TechnoCadd 4 to the new machine?
What about a compatible version of Xenomorph, - Apex and many more?

BTW, did he mention whitch late autumn/early winter? This year or the next?

cheers

Joergen

>STatus.
>> I am certain it will be worth the trip. I may even give you one of these
>> STs for your trouble:-).
>
> I didn't know that plane tickets from Europe to Canada are so cheap... And

Oh yes, infact to go to Yugoslavia, I can get there for free. All I need to do is re enlist in the Army, and they will send me there. Perhaps I should go there and let you crack the game instead, and show me all the local tourist sites.

>I don't have place for more Atari in my room. And I don't think that travel
>to Canada is trouble :-) .
> Maybe here... and high risk ! :-)

Yeah, there is no risk coming here, and enlisting in the Army doesn't get you a free trip here. With only 3 Ataris how can you not have a place for another?

>Oh, other problem: I need visa to Canada. Will you write warranty for me ?

Oh, this is no problem. You just land in Canada, without a VISA and claim refugee status and you get to stay, with all housing and food paid by the government + a monthly allowance. Starting to sound like a good deal now isn't it? This is how I intend to pay you. With Government funds to modify my Atari, while you visit. You don't like things, you just go back home, after site seeing of course.

Will I write a warranty for you? A warranty to me implies that you have done some work and are going to protect me from any problems caused by your incompetence. Therefore, the only form of warranty I can see, is that if you modify the program and it doesn't work, then you will have to FLY back to Canada, again, claim refugee status again, and enjoy another stay here.

Don't forget to bring your Skiis. There is alot of snow right now.

Merry Christmas.

Brian.

P.S. If you wish to send one of the those beautiful girls I see on Television, instead of yourself, this too will be acceptable and I won't give a damn, whether she can crack RVF racer or whether she even knows what a mouse is:-).

> Cheers, Pera

>.

Hallo Patrice!

PG>Does anybody use CD Lab as CD Recorder ?

Well, I tried to, but didn't manage to get it to work. On the Milan, it won't see any SCSI devices and is not able to read from the ATAPI CD-ROM.
On the Falcon, it will see both the Pioneer CD-ROM and the Yamaha 4260, but won't do anything when I click on "copy". I did try it with both MagiC and TOS 4.04. Latest HDDRIVER 7.8 and Spin! for the hardware access.
Sorry, no go yet :-(

Not sure if remember the original problem (I've deleted the text),
I think it was about finding the baud rate changing back on booting...

Anyway, I wonder if the line in your INF file that begins with #a
is interfering with the setting in SERIAL.CPX when you boot up. I'm
not sure that this is possible, so I would like someone else to
confirm or correct this.

Both my INF files have '#a0<0021' where the '<' stands for 130 bd but,
with HSMODA7 installed, means 57600 bd, which is what my SERIAL.CPX is
set at. My STING.CPX is set Active On (crossed), Delay at 20.

';' (150) would mean 115200. '=' (110) 38400 and '>' (75) 19200,
unless I have remembered incorrectly (Someone?). Which rate was
required?

This is on a TT030.

Christmas and Holiday Cheers!
Charles.

4555. 2nd MIDI-in for ST?

Newsgroup: comp.sys.atari.st
Date: 1999-12-25 00:00:00 UTC
From: Bernhard <noise@hrz1.hrz.tu-darmstadt.de>
Message-ID: <38654240.45BAE724@hrz1.hrz.tu-darmstadt.de>
Source record: 68266

Hi there!
does anybody know where to get schematics for an extra midi-interface
running on the serial or parallel port of a ST machine
that supports another MIDI-in?

i already know those two port-designs shown at

http://www.freeweb.org/computer/vezz/atari/hardware/serial.htm

but these won't do MIDI-in.

thanx! kcalien@gmx.net

> Not to be picky, but in CAF you have 16 tracks mono audio, 8 tracks
> stereo audio. Ok, so I AM being picky... :)

This is not completely true...
You can use 8 mono tracks or 4 stereo tracks in full DAT-quality.
The 16-track mode allows 16 mono tracks and no stereo tracks - and you
also loose the built-in effect possibility by swithing to the 16-track
mode (if you, for some strange reason would want to use those effects).
Furthermore, the 16-track mode uses compression of the data, which means
you'll loose somewhat in sound quality - but it all depandes on how
picky you are with the result... ;)
I still love the Falcon (and the Atari platform in general) - but I felt
that I needed some of the extra funtionality that VST offers - and I
wanted a program that's still updated and bugfixed - which CAF isn't :(

Best wishes,
Claes

Not familiar with the specific product, but as I recall, the TT had an ST compatible cartridge port, and the Falcon was slightly different, one of the reasons I've heard for Spectre GCR not running on the Falcon, or being too big a job to make Falcon compatible.

Sorry, I posted a reply to this, but didn't see it, so I am saying the same thing again. Obviously the browser is crude. However I have no trouble going to many web pages and quickly getting the Text. It is much faster than Cab in this regard. This is generally handy when you just want to check a page to see if it is worthwhile. Being Lazy, I just click the URL NOW, and have been testing many of the sites in Atari Posters URL signatures. It can also go from site to site quite well. Eventually you will crash however:-). But as for getting quick text fast, it is very handy. I had been typing in URLS for this for some time now. Certainly it is better than nothing. Besides it works well on 1040ST.

Maybe Newsie should be
>considered as an embryo for a future all-in-one Internet application,
>now that CAB is no longer developed and Wensuite and Draconis seem to
>have all sorts of problems. With a development in handling HTML,
>some rearranging (I think that the positions of miscellaneous functions
>in menus are a little chaotic) and a little estethic make-up,
>maybe some Newsie 1.99 will be...

I don't know if CAB is no longer developed? I do know that there was a minor upgrade for version 2.8. I never believe that software is abandoned. I remember Soft Logic telling users there would be no ST versions past 1.8 Then past 2.1 and I wasn't with Ataris when 2.2 was released. I remember with each release of Word Perfect, it was always the last one. Since Development of CAB has been slow for the past year, I think even the minor upgrade is a positive. So who knows about the future.

Never used Wensuite or Draconis. Also is Light of Adamas same as Draconis or something different again? I do like CAB alot, especially its modular nature. I think this is a benefit.

I do agree, that NEWsie is a good all in one package. There is still alot of work to do. I believe the Browser suggestions you could ask for would be a full time task. Then I agree, the menus could use a little restructuring. NEWsie is a Great PD package. I can't thank John Enough. I tend to use it far more than CAB. However before we even talk about HTML with NEWsie there are still alot of NEWsreader functions that could be implemented, better FTP control and compatibility and more email functions. Certainly a big job and hopefully not a thankless task for the author.

I hope everyone has registered NEWsie with the Author as I am curious just how many users there are? I do know that in the last year, many NEWsie users have changed to other software or other platforms, but even still, I am amazed each time I see a new NEWsie user.

And while I like NEWsies all in one approach, I think this is great, but I think that modular flexibility provides faster opporunities to upgrade each function.

>I know that it requires a lot of work and time that the author probably
>has limited amounts of, so this is just wishful thinking...

I am wishen with you:-).

>the offline approach?
> John

Well, if you wish to stay online while posting a message, talk to you IP provider. Or if you were using a multi tasking system, I believe you are not, you can just keep checking NEWsgroups, or download files with FTP in the background, or run mICQ etc. Something to keep that little modem active.

However I am a believer that if you are online while posting a long message you are just wasting a connection. So I am in favour of such disconnections, which is why IPs have this implemented. I have a horrible little nephew who connects, and then leaves to play outside, then comes back and his IP doesn't disconnect him. But I just want to DISCONNECT HIS HEAD!!! Opps, christmas time and I am getting him expensive presents, thats right, what a good nephew:-).

So I hope offline posts workout for you, once you do it, it should be straight forward. You have been given some good information on this approach from the other posters, so I hope to here of your success or failure.

Just Thought I would add my Merry Christmas and Happy New Year.

I would also like to tell you about a stupid girl so afraid of the millenium bug destroying the world that she isn't going out for NEW YEARS but wants to be at home with her family and cat for the end of the world, or some other minor disaster that destroys the human race.

I asked her when she was going to her parents and she said around 10PM.

I said she had better visit her parents earlier than that if she wants to be with them before the destruction of planet earth. She said why should she go any sooner.

I said if the world is going to end I expect ONE BIG BLAST and not destruction by TIME ZONE. I can see it now, the world destructing by time zone and just shortly after Quebec is eliminated, and Q-FUNK has nowhere else to hide, I am going to turn my clock back a few hours and let the destruction bypass me:-).

Peace in the world with my Atari ST.

Later Brian

Happy Holiday to all.

>Comparing the speed is one thing, but what about the quality?

Right now I am looking for speed. My TT is doing everything way faster than my Falcon, and I think it is DSP related. First I want the Falcon decoding JPGs at atleast the speed of the TT in CAB. We are using GEMVIEW as a Test Facility only. I just happened to see how fast Aniplayer loaded.

>I've done some testing here myself and found that the quality of
>dithering differs a lot, ranging from very poor to excellent. I've
>loaded the pictures in 256 colors, 32K, 65K and True Color (32 bit), in
>every test Photoline 2.3 68030 version was not only the fastest but also
>give the best dithering. Second was Vision 3.5 closely followed by
>Papillon 3.04.

Well, my TT is lacking about 24bits of colour compared to yours:-). Have the Photoline demo. But you are on the right track. I am looking for the speed and quality of these programs from within CAB. However I would like CAB itself, to be reacting faster with Regard to decoding JPGs and I believe it is a setup problem on my part.

My TT is twice as fast as my Falcon, and I don't believe this should be the case, with the DSP in the Falcon. So first I want to find the speed in the Falcon, put my mind to rest and then move on to quality. Which is why I am not using my TT in the first place. But as things are, my Falcon, is just faster than my ST.

>Aniplayer was not really fast, the displayed picture is very poorly and
>it can't display pics correctly in true color.

Possibly true. I was just trying another program, and noticed the speed difference. So I know it is possible to get faster JPG response.

>Photoline and Papillon don't take advantage of the DSP, but Vision does,
>so I suppose on the Falcon this one should come out tops...

Now I am interested:-). I am surprised Photoline doesn't take advantage of the DSP? I don't even know what Papillon is other than a movie with Paul Newman. <g>.

>In general Photoline is the best allrounder. It can handle most formats,
>loads all of them extremely fast and the displayed pic looks good.

How about as an external viewer for CAB? a little bit of overhead, I would think. I have actually never tried using external viewers within CAB.

>As far as browsers go, WenSuite is the fastest, but the pic looks
>terrible, and is not correctly displayed in 32bit true color.

I have never seen anyone, use or post a message with WenSuite. So if it is fast but doesn't work online, I find little use for it. There you go with that 32bits again:-(.

CAB 2.8 is
>very slow but the displayed picture is very good. Draconis Pro is the
>slowest, the pic looks ugly and in true color mode is not correctly
>displayed.

I understand CAB being slow. But I am not understanding why my Falcon is so much Slower displaying a Picture than the TT. I can only imagine how fast the TT is with a graphics card.

>Giving loading times for jpegs is not easy, because of the various
>degrees of compactation. I used a 4MB TIFF which I converted to a 200kb
>JPG. The fastest programs needed about 10 seconds, while the slowest
>took a very long 2 minutes.

No, I understand this, Gemview just happens to print the time, which is why I used it as a reference, and I am getting help from others who mentioned the program so, I used it to try an diagnose whats going on. They are getting faster times in Gemview and I would imagine with CAB, using there Falcons than I am with Mine.

>Loading and displaying the 4MB uncompacted TIFF is accomplished in less
>then 4 seconds. Loading the same picture from a ramdisk, is 0.3 sec
>faster.

5 Seconds isn't a bad trade off for the 3.8meg saved.
What is a good ramdisk program for both the Falcon and the TT?
I don't need a recoverable one. And if it works good on the ST, that is fine too:-).

>All these tests have been done with a ATI Mach64 graphic card with Nova
>driver. I suppose that doing the same tests on a Milan II with a ATI
>Rage II 128 card, will decrease the loading times to less then a second.
>A mouseclick so to speak...;-)

Bah, you are making me sad. <G>.

>Photoline and Papillon are both commercial, Vision is shareware and can
>be downloaded from http://vision.atari.org, an English version is available.

Click!!!:-).

When I first downloaded this prg. I only had my ST, and actually forgot about it. Has anyone tried to use this program in Medium Res, on an ST? The only thing that gets blocked from view is the actual dollar amount you have converted:-).

Anyways, I just wanted to see what it looked like on the Falcon, and it certainly looks pretty.

Later Brian.

I wonder if that is the cause? In these circumstances one would expect
that most of the time to display is taken by the dithering, which is
presumably not a function of the JPEG decoder.

>Picture SIZE Falcon JPGD.PRG TT FALCON no JPGD.PRG

In message <840u29$6ub$2@brokaw.wa.com>, csilver@Puke.On.Spammers.com said:

>Anyone know if there is any English docs for the freeware prg, CBHD502?

There should be a translation I made some time ago on the author's web page, or available from him at Steffen.Engel@t-online.de. There has been an english HYP for some time for CBHD itself. (I have recently updated some of the docs for SCSIDRV as well and these should be there too, but these are only of interest to programmers).

>The docs are in German hyp file. There is a warning in there about using
>the SCSI stuff on a Falcon, but not sure what's up. I WAS able to format/
>partition a SyJet 1.5gig cart I had buggered up "real good" using AHDI.

From the HYP:

The various Falcon problems can, unfortunately, give rise to very strange effects. If you have problems with your Falcon, first make sure that it is properly set up before asking for solutions to your problems.

WARNING

Some Falcon030s have problems with the SCSI-port. This can lead to errors when accessing SCSI devices that result in loss of data.

In particular, fast hard disk drivers in association with fast hard disks will occasionally exceed the limits of the Falcon SCSI-port.

Usually such errors can be corrected by a hardware modification to the Falcon. Here are the instructions for this patch, with the compliments of Michael (Chip) Ruge:

MODIFICATION GUIDE for the CPU clock/timing signal

There are problems with the sound system of some Falcons. These show themselves either as clicks and scratches, or during the recording of long sound files on the hard disk (SCSI errors).

If screen pixels begin to shimmer after a memory expansion has been added, this has NOTHING to do with the 16MHz clock signal or this modification. The twinkling pixels on the screen arise from the fact that the RAM chips cannot keep up with the computer timing!

For the Falcon-Wings from Heyer and Neumann in Aachen, the manufacturers themselves recommend using ONLY SIMM-modules produced by HUNDAI or MOTOROLA.

(Details of Falcon-patch follow)

Regards, /Peter/

I don't remember what it stands for, but it was a program that automatically converted archives from one format to another, and also changed the file description on your BBS to reflect the new extender. It was a very useful tool for BBS sysops who wanted all their downloads to be uniform.

A quick check shows I still have the registered disk (before it became freeware). I also see that CWAK stands for Cool Wave Archiver Converter.

>"you get far enough to use STings Log File? Is it PPP connection with PAP or
>"script?
>"

Brian
The problem (I think) lies in the DIAL.SCR where the flag is set for
the dialer to fetch the IP address. The Free-online ISP is server
assigned, as I understand?? If this is so,in the DIAL.SCR the
Client_IP is disabled and $Get IP is enabled, this then fetches
the IP address. I am not used to this gargon but this is how I
interpret what I have read from all the TXT's I can find.
I know from the STING.HYP file that there"s a fault with the
"Your IP address is" statement in the DIAL.SCR. There is an
ammendment.

But when retyping the correction the Modem still shuts down
the attempt to connect.
I may be better off asking if someone has a working
DIAL.SCR using the $Get-IP flag and copying there
workings.
Hope I have been clear as I said earlier I am from far
being no wizard at any of this but I think I am very
close to connecting to Free-online, I would like to
follow it through.
Regards BILL

Um, it shows! Commiserations, Dennis, but before you get a replacement keyboard, try this: carefully dissemble it and stick small double-thickness pads of sticky label _under_ each contact node on the mylar. The effect is to raise the nodes so that you do not have to pound the keys. And then, do _not_ pound them! It really does work

Oh, and check the track at top left (right on underside) that it is not broken: it probably is *, or will be shortly, and will disable the Control key. (Now, who posted this advice some time ago? I think it was Mario B).

* If it is, very carefully solder a link wire across the break, or use a cold metallic solder (forget what it is called).

Good luck and Happy New Year to you and all here.
Charles.

PS. And yes, bring back Katherine: I enjoyed her arguments, though rarely understood.

According to Ronald, STinG 1.20 up use modules differently for more efficiency. Future modules will be designed to work with the new modules and may not work correctly with STinG 1.15 and earlier. By sticking with 1.15, although it works well, you may not be able to take advantage of future improvements. I believe 1.20 up are faster as well and more efficiently coded.

All your tests must be done in the same color modes, otherwise
dithering comes into play. I can tell you that CAB skips dithering
entirely in all TC modes (15/16/24/32-bit) and makes surfing enjoyable.
The depacking is the only thing you have to really wait on, that and
download time. So surfing with a Falcon in TC mode with the Brainstorm
depacker setup right, should be faster than a TT with a gfx card in TC.
I've never had my Falcon on-line surfing, but I did do some jpeg loading
tests and the Falcon beats my TT at loading jpegs in TC.

Hi,
A rather childish reaction if you ask me; Leaving the group when not all postings agree with your opinion...
I'm a full-time PC-driver now (flame me if you must, but that's the truth) - after enjoying several different Atari machines for years and years - and I still enjoy taking part of this group to exchange knowledge and to continue keeping in touch with my computer "roots". I do have one of my Falcons left and I wouldn't part with it for anything. Call it nostalgia or something else, but I really like the slow, old, "crappy" machine that's given me several years of joy - with many songs written by the help of it and CAF, which was an extremely stable and professional choise when it was new - and still is a very good choise if it suits your needs and if you have a tight budget. My PC gives me more functionality and a stability equal to - and midi/audio timing even better than - my Falcon, in spite of what most people keep saying in this group. The stability problems on PC's was true a couple of years ago - but not on modern machines. The midi/audio timing problems are still there when you use standard, cheap soundcards - but not otherwise. Anyway, I'll keep reading this group and I'll keep the Atari section on my website even though I'll probably concentrate more on music and PC in the future - and I'll still be available for any Atari- or music related questions, since I want to help with the big experience I've gained as a technician as well as user during the years - after all, I've repaired more Atari computers than all that are used by the people reading this group - so I think I have something to contribute with to keep the platform alive... ;)

Best regards,
Claes

http://www.umich.edu/~archive/atari

Go to the Emulators directory and you will find stx255.lzh as well as a few
support files for the emulator. The emulator is called the xformer I think
and was made by Darek Mihoka. I don't have an 8bit and haven't tried it.
Also this may not be the latest version. It may be located on the Gemulator
WebPage. I don't have the URL for this.

Regardless, checking out the umich atari archives is always fun, especially
if you have an ST.

Thanks Mike that was it. I have a TON of FONTs on my Falcon, and not so many loaed on the TT. I had no Idea it was search the Fonts. I didn't load any fonts just to test, and sure enough, all was well, and the speed increased close to the TT.

Actually, I remember trying this with my ST, when I first got on the
internet and had NO idea how big pages or or the Cache could become.
Of course I only set up a 1meg ram disk. Short lived, but faster.

> The table calculating
>is the worst on any Atari. Can take 5 minutes on an ST, depending on the
>page you are viewing.

Well, on the ST/TT/Falcon this was dramatically reduced after 1.5. Up until
this year I used 1.5 with my ST. I think the Best Electronics components
page was enough to make me cry. However I use my ST frequently and Tables
aren't that bad anymore. On the page I was talking about, My ST was loading
it in Faster than my FALCON. I have found the culprit however.

> TT has Falcon beat in this area because of the
>32MHz CPU vs 16 on the Falcon. Don't know if CAB uses the FPU, but if
>your TT has FPU, and the Falcon not, this could also be a factor. I
>revved up my Falcon with a 40 MHz CPU and got CAB running about half the
>speed of Netscape.

1/2 Speed of NETSCAPE? On what computer is Netscape running, how fast??

I have seen PCs display pages almost instantly, and then I am at my friends
house and I have seen my ST load the same pages faster than his 200MHZ
running IE. The TT however, I am so happy with it, other than its lack of
Colour. And my ST was limited to 19200 vs his 28800.

My Nephew had a Pentium 150 and a 14400 modem with IE. You want to talk
about SLLLLOWWWWWW. My ST KILLED IT for speed and using CAB 1.5 no less.
Of course I stayed away from large tables:-). Needless to say after I got
my ST hooked up to the internet 2 years ago, he decided he needed a new
computer and faster modem:-). And it was his OLD ST that I used to get
connected:-). Regardless, he wanted more colour than the ST could give.
Really important for IRC which is where he spends most of his time?

Thanks for your information.

4596. Weird problem with MiNTnet

Newsgroup: comp.sys.atari.st
Date: 1999-12-26 00:00:00 UTC
From: Ralph Lowinski <rl@aquaplan.de>
Message-ID: <3865704D.645D1F3D@aquaplan.de>
Source record: 68278

Hi,

I have now installed MiNTnet 1.04 on my ct2-Falcon. After starting my script, pppd comes up and dials in. Then I can see with route my provider's and my (dynamic) IP. Now I can do ping, nslookup and traceroute and all three are working fine. But trying lymx or ftp no connection is possible. I think I have configured the necessary scripts right; I did it the same way as on some Linux boxes before and I never run in such a problem before: Either there was no connection at all or TCP and UDP were working also.

I'm really baffled if this is a problem of the kernel 1.15.5, my hardware or even some more special needed software settings. Has someone ever had a similar problem and, probably, a tip for me?

Thanx,
Ralph

> In ONE Case the Falcon beats the TT.
> In ONE case the FALCON JUST STRUGGLES with or Without JPGD prg.
> Whats up with this, as this is more often the case, there being large JPGs
> on the internet.

When you use GEM-view do you have verbose on? If you do, watch the progress of loading a JPEG...when a JPEG is loading the first thing GEM-view does is identify it as a JPEG and determine its size in pixels. Then it decrunches the picture. At this stage if you can see a '------' progress bar in the log window then the DSP is NOT being used, as when JPEG's are uncrunching there should be a brief pause as GV hands the file to JPEGD, then GEMview should tell you it is working out the palette or dithering...

My own Falcon has a 32MHz 030, but that makes the 'whole' machine only roughly 30% faster than a stock 030, as the bus is still 16MHz...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Heya, Barry! Hope you had a good Christmas...

Although I may still be on a chocolate-high *and* fighting insomnia,
all I can say is not to worry... even if my MegaSTe isn't Y2K
compliant...

** It's NOT doing any date-critical work! **

Software that relies on dates for calculations
(financial/accounting/forecasting stuff comes to mind) may goof, but
for everything else (i.e., Obsession Pinball and STiNG/CAB/whatever..
=)... d-o-n-'-t p-a-n-i-c!

Sit back and relax.. pour yourself an ice-cold Coke. :)

Most likely those PC boards use the system clock.. Why add a clock to
such a board when you can just leech off the system clock? <grin>

Cheers,
Derek

>>hell is
>
>I disagree with that assessment, particularly if you remove all the posts
>complaining about the non-Atari messages. Comparing other platforms to
>Atari DOES have something to do with Atari.
You don't agree?
I don't remember asking for your assessment in the first place. I do
remember asking you to respect my choice, after an endless streams of
postings offering us a different perspective... (80 columns thread). You
said you would but haven proven otherwise. Others here have asked you the
same thing the last couple of weeks, you just don't give a damn... I think
you're enjoying this.

>Who was flamed for being an Atari user, and by whom?
I have called Katherine Kellis a Klingon woman, I even compared her with the
rear end of a donkey, and she has given me all kind of petty names aswell.
This was *ALWAYS* in the heat of a discussion....
I would never ever even think of calling her a moron... If you follow this
group like you say you do, you should know that Kellis doesn't deserve this.
And yes it's me, one of the "other side" who's writing this. She has a way of

ticking people off, but is open and straight about it... I respect her for
that. I respect her even more for the hard work she does involving the MiNT
platform. Every one who contributes one way or the other, trying to keep this
platform going deserves respect.
And then you come in here calling her indirectly a moron... knowing very well
that she would react to this, which would give you the chance to go in
another clinch with her, or anyone crazy enough to reply... well, it looks
like it worked... one out...another nine left on the list. Who's the next
target?

>>>I just don't get it. I live for my atari, go to work on piece of crap
>>>computers, then go home, I want to enjoy my hobby, can you let some people
>>>have that piece in peace?
>>The above quote was posted by Katherine yesterday, I recognise myself in
>>this, and couldn't have said it any better... for the very first time I
>>actualy agree with something she wrote. Are there any others here that feel
>>this way?
>
>I don't. It's silly. Why would you enter a thread with "PC Choice" in the

>subject, knowing that any discussion about PCs bothers you, and then whine
>that people are ruining your hobby by discussing PCs? It makes no sense.
Call it coincidence if you will, but ever since you started posting your
endless stream of garbage the general mood in this group has changed. And
NO, I refuse to use a filter... this is my favourite newsgroup, I will not
put filters on it.
You must be joking !! you come in here, spoiling the fun and when people
object to this, you tell them to use a filter... You may find it normal to
discuss PC hardware, software, OS's and propaganda in a Atari newgroup, I
don't.
It's like going to a newsgroup for vegetarians and start posting the virtues
of meat in there.... and to top it off you tell all the people in that group
who object narrow minded and to use a filter...

What I will do is ignore you, you don't contribute to this group, all you
do is cause havoc. And if you "help" someone you give him information that
is out of date, whenever you mis-inform someone, me and no doubt others will
make sure to correct it...if you have nothing meaningfull to contribute, you
shouldn't post anything in the first place.

>I agree that it's a great group (that's why I'm still here). But it would
>be even better if EVERYONE was a little more tolerant and not insist that
>everyone else conform to their own narrow viewpoints.
>
>I think most people here are very tolerant and open minded, but there are a
>few that aren't, and they make a lot of noise, leading to the very off-topic
>posts they love to complain about.
Yep, we're diehard fanatics. One has to be or he would have made the switch
to another platform long ago. I'm one of those few that has been tolerant and
open minded, but enough is enough.

BTW: complaints about off-topic posts have *NEVER* been an issue here, since
you are back they suddenly are, strange isn't it.?

Cheers from Belgium
Dennis

>
>Now this is what I want in CAB.
>
>More later.
>
>Also thanks for all the replies. I hope there are more, as I am still
>learning about my Falcon.
Comparing the speed is one thing, but what about the quality?
I've done some testing here myself and found that the quality of
dithering differs a lot, ranging from very poor to excellent. I've
loaded the pictures in 256 colors, 32K, 65K and True Color (32 bit), in
every test Photoline 2.3 68030 version was not only the fastest but also
give the best dithering. Second was Vision 3.5 closely followed by
Papillon 3.04.
Aniplayer was not really fast, the displayed picture is very poorly and
it can't display pics correctly in true color.
Photoline and Papillon don't take advantage of the DSP, but Vision does,
so I suppose on the Falcon this one should come out tops...
In general Photoline is the best allrounder. It can handle most formats,
loads all of them extremely fast and the displayed pic looks good.

As far as browsers go, WenSuite is the fastest, but the pic looks
terrible, and is not correctly displayed in 32bit true color. CAB 2.8 is
very slow but the displayed picture is very good. Draconis Pro is the
slowest, the pic looks ugly and in true color mode is not correctly
displayed.

Giving loading times for jpegs is not easy, because of the various
degrees of compactation. I used a 4MB TIFF which I converted to a 200kb
JPG. The fastest programs needed about 10 seconds, while the slowest
took a very long 2 minutes.
Loading and displaying the 4MB uncompacted TIFF is accomplished in less
then 4 seconds. Loading the same picture from a ramdisk, is 0.3 sec
faster.

All these tests have been done with a ATI Mach64 graphic card with Nova
driver. I suppose that doing the same tests on a Milan II with a ATI

Rage II 128 card, will decrease the loading times to less then a second.
A mouseclick so to speak...;-)

Photoline and Papillon are both commercial, Vision is shareware and can
be downloaded from http://vision.atari.org, an English version is available.

Cheers from Belgium
Dennis

Marry Xmas Joerg, and a new holy year full of joy!

Just yesterday I've put my hands on jetmail, as I still need to adjust
something for my gateway system.

I need to separate netmail in different areas, as a lot of messages are
coming and going from internet, so this is what I did.

Two netmail areas define, the first is the typical "FidoNetmail", the second
has the "-Netmail fidonet.org" option in AREAS.BBS.

This way I can write in both areas and messages can go to fidonet, and emails
to the gateway. This is just a "feature" of jetmail that accepts msg outgoing
from the FidoNetmail area for a domain even if there is another area for that
domain, this is ok, we can consider FidoNetMail as the "Jolly" netmail area.

The problem is when receiving, how do I filter incoming msgs ? Simple, we let
all msg for the fidonet.org domain go in the FidoNetmail area, same "Jolly"
concept as above, even if a different area is defined for that domain.
Here is the real point, I need the filtering, and it is done by the gateway
software, I intercept incoming emails with particular FROM, TO, SUBJ or other
filter and and put it in a special area instead of netmail, but guess what ?
I send them in the secon "-Netmail fidonet.org" area, considering it echomail
when importing, well THIS WORKS ! I just got I/O errors for the access to the
filearea so I changed this routine forcing Jetmail to skip the searching for
the right netmail area:

AREA *SearchNetmailArea(DOMAIN *domain)
{
/*
** Function: SearchNetmailArea()
** Status: Global
** Description: Sucht nach Netmailarea
** Returns: AREA Pointer auf Netmailarea
*/

AREA *area = setup.areas;

/*
while (area)
{
if (!(area->flags & A_NETMAIL))
NextLoop (area);
```

```
if (area->domain == domain)
return (area);

NextLoop (area);
}
*/ return (netmailarea);
}
```

As you can see I simply always return the default FidoNetmail area.

The thing should be done in a cleaner way, adding options in the configuration, but this small change was very easy to do. BTW if you get the time to read until here, maybe you have some suggestions aabout this subject.

On the contrary, it was a way to keep in contact

I did not heard about new Semper versions and features, and also NeST is completely dead, at least for my uplink Peter Carr, so I just want to tell you I did myself some small changes at the code:

3 functions added in the "Action" menu:

Manual answer ^A : answers like after RING detection
Speaker ON ^+ : ATM1 sent to the modem
Speaker OFF ^- : ATM0 sent to the modem

4609. Jetmail BUG

Newsgroup: comp.sys.atari.st
Date: 1999-12-26 00:00:00 UTC
From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <11694_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 68291

In the end I was able to find the time at Jetmail sources and found the old BUG about AREAS.BBS with small letters in areatags.

Jetmail is able to search the areatag with a stricmp, but as the search is a binary search, you need a sorted list of areatags, BUT the sorting is done with strcmp, so sometimes (apparently random) the echotag is not found and the aread is readded if autoarea is enabled.

I just changed the strcmp in stricmp in InitAreaSort and all is ok now.

If anybody interested I can compile the fixed version, but I would really like toknow if anybody is still using Atari and Jetmail for FTN..... 8^(

if it's any consolation, we know at least the hard disk driver software
can handle it: Uwe's current version of HD Driver can handle DVD-ROM
drives. Now it's just a matter of writing the proper software to handle
showing DVD on a Milan's screen.

Hi Bill, since you obviously have installed STing in the Past, can you please, state or restate, as I know this thread has been on for some time, just what the problem is again. Just where is the problem occurring? Can you get far enough to use STings Log File? Is it PPP connection with PAP or script?

Later Brian.

>identify it as a JPEG and determine its size in pixels. Then it decrunches
>the picture. At this stage if you can see a '------' progress bar in the
>log window then the DSP is NOT being used, as when JPEG's are uncrunching
>there should be a brief pause as GV hands the file to JPEGD, then GEMview
>should tell you it is working out the palette or dithering...

I have Jpgd 12,25,1994. After I autoboot it, I double clicked it and it
gave me the message it is already installed. (I was just checking to see if
perhaps it was corrupted), Sure enough, I use GEMVIEW with JPGD loaded, and
DSP selected in the Globals menu. (I actually turned it off, to see a
difference), and GEMVIEW immediately goes to '--------'. So it is not
passing it off. STudio Photo identifies the external JPG decoder.

Clearly both GEMVIEW and CAB are NOT using the DSP. CABs time to load the
picture from local, is very close to GEMVIEW.

Now, one more thing however, is that with JPEGD not installed, the Falcon
unpacks the JPGs about twice as slow with regard to the smaller JPGs. So
something is working, if you check my chart again. Also in every case, I
have the Bar line appears.

>My own Falcon has a 32MHz 030, but that makes the 'whole' machine only

Hi Tomy,

try the DOITF030 archive from

http://www.atari-computer.de/doitarchive/homepaee.htm

It's very large (7 files ï¿½ 1MB) but it contains really a lot of stuff,
also for repairing.
You need to send the author a short email to get the key to unzip the
files. It doesn't cost anything, but the author wish to know how uses
his work (what I can really understand).

The problem is: There are no errors, but netcat and lynx are waiting for
for responds. But I will controll the pppd's for that settings.

> One common feature of ping, nslookup and traceroute is that they don't use
> TCP, unlike lynx and ftp. Maybe this is some kind of clue.

This sounds logical. But it seems that get further a little bit on
diagnostics. If I retrieve a nonexisting URL from the provider i.e.
echo "GET /foo.bar" | nc proxy.arcor-ip.de 80
I get back a HTML error-message from the providers deamon. I'm not
shure,
but this seems to show that I can receive TCP packets. So I think, it
have
to do something with my provider(s). I tryed several and always the same
problem.
And that's the big question now: Why get I only response a wrong
requests
and not on a correct one?

Best Regards,
Ralph

Ah, Brian, Brian, Brian! I like the way you think! Just about all that is
true (minus the old lady). As far as on-line time is concerned, My ISP
gives me 15 minutes of innactive use before cutting me off. However, that's
not the case with the news server. A couple of minutes there and that's it!
So there's no problem with net surfing, only NG's.

Last time I saw a post about it I mentioned that I had not been able
to get thru to the support BBS for a couple of months. I got an
e-mail back saying he was relocating from PA to New Mexico I believe
and he didn't think he'd be setting up the Support BBS anymore.
So, I'm not sure if he's willing to sell of or make it PD or whatever
to the remaining ST users.

Yes, you are right. So it is not so simple then.

I am not expert enough on TCP to understand this problem, but I know this
does sound almost exactly like what happened to me when the MTU and MRU
values were set badly. I must say I don't know why this would be, since
packets should just get fragmented if they are too large. Maybe someone
more knowledgable in these matters can explain this.

: So I think, it
: have
: to do something with my provider(s). I tryed several and always the same
: problem.
: And that's the big question now: Why get I only response a wrong

Perhaps because the error response is smaller than the real response? I
really don't know.

I think you should check the settings for PPP, the problem must be there.

Don't know about the hardware, but you may well be affected by any DOS
Y2K issues (check the M$ web site for details) and you need to check for
any compliance issues WRT the software you are running.

Just a note,

solved my own problem this morning. Remembered that Notator SL defaults
to a NEC. So I tried the NEC Series driver. It worked!

thanks again.

That sounds like a job for HDDriver, you can order the device scan as you wish and also reserve ID's for removable drives.

> have the Bar line appears.

I did a test last nite to refresh my memory. I unpacked a 790x504 JPEG
into GEM-view with DSP on/off. With DSP on the actual depacking time was
around 6-7 seconds, but then I used Floyd-Steinberg dither with an octree
palette and the total time was 1 minute 22 seconds. When I switched DSP
off the depacking took almost a minute alone, with a total time around
2 minutes 20 seconds. The dither method is the same so will take the same
time so the actual raw depacking part IS about 8-9 times faster with JPEGD
than GEM-views own 68k based rout on an 030 at 32MHz...

> >My own Falcon has a 32MHz 030, but that makes the 'whole' machine only

John Britten lived in my home city, Christchurch. We regarded him as an
eccentric but genius individual. I've seen the garage he used to design
the V1000 bike, and it really is a garage just like you and I would park
our cars in! To think he could take on the Japanese big boys and win was
incredible! It is sad that he lost his battle with cancer, and also sad
I haven't seen one of his bikes race at the local raceway yet!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Which will just be a case of using a high power gfx card like a Voodoo3 or
ATI Rage128 that has on-card hardware MPEG II decoding. Tha transfer of data
to the card from the DVD drive should be a piece of cake to handle, even for
a slower machine...

hmm, is it THAT easy? I am duly impressed.

Still, there will be a need to write a middleman program for the Milan
II for playback/rewind/fast forward/stop, as well as accessing some of the
extra features of the DVD like documentaries, scripts, specific scenes,
etc. Like the new Wizard Of Oz DVD....

I just had a thought, though - wouldn't you be able to do that with the
Eclipse card on the Falcon utilizing a Rage card?

that would not work on this keyboard, when i took this one apart to replace the plastic sheet membrain inside, some of the "HOOKS" that holdthe metal sheet backing on roke off, what i need is the plastic keyord housing, the keys are ok, the sheetis ok, but with the jerry riged spacers that hold the sheet up against the keys, it's hit and miss as to anything works. i've already lost the control key andthe leftside shiftkey. that's whyi've een lookingfor an old keyboard, i just need that plastic housing. but it looks like i'll keep on using it this way.

Steinberg has the MicroMidi interface that adds 1-in/1-out to Cubase
using Falcon only. This is a Macintosh interface that works on the Falcon.

Obvious solutions include Midex, Midex+, SMP-II, etc

Unfortunately I spent 5 minutes with it and gave up. Get an SMP-II for the
TT
and that's it. For Cubase I mean. Or else get the Log3/Unitor2/SteadyEye
combo
for Logic.

> >And they are bloody cheap

No, Cubase 2.0 does not run on the TT. 2.0 runs on TOS 1.4, 1.2 and lower.

4638. printer driver for SpeedoGDOS v4.1

Newsgroup: comp.sys.atari.st
Date: 1999-12-27 00:00:00 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3867064a$0$4652@news.execpc.com>
Source record: 68223

Hello,

I wish to use SpeedoGDOS (v4.1) with Atariworks.
Unfortuantely I am not able to get my document to print properly.

The install program prompts for Epson LQ-750
Yet when it installs it is Epson LQ-570.

Does anyone know if there is an Epson LQ-2500 driver available?
(An Epson LQ-1500 or LQ series would also work)

Thanks for your help.

Happy Holidays

Caught my attention too, I found a copy on the UMICH archives.
CWACS 3_02.zip

I am not certain if it is the same as above, as I haven't downloaded it yet, I just look at my printout of UMICH which is over 93 pages in size. It is in the archive section and says it converts all formats. Of course no mention is made of Gzip, or Tar etc.

Well, possibly. I have no idea what your provider has set the activity level at. I find the IPs that have unlimited time here, tend to disconnect inactive users in a very short period. My friend does as you do, writes online and simply reconnects when they disconnect him. Of course he is using a PC and a Multi Tasking system, so you don't have this luxury.

I have 1 hour of access from 9AM to 11:59PM then after Midnight to 9AM in the morning I have unlimited access. Which is essentially 10 hours PerDay. I seem to have enough time to write messages online, I have had up to 5 minutes. Sometimes I am disconnected sooner if they are really busy, then there is someone there manually borfing me.

If you think you need a hair more time to reply to messages, tell them you are an old lady and a slow reader with bad eyesight, with arthuritis, and no teeth, and see if they will up your inactivity level another minute or two.

Finally made the connection here"s how.
Used your instructions, I did not fill in the
script except for the $GET_IP part.
I then OK'd the warning Dialogue and
then the connection was stable.
Many thanks to you and to all who helped.
REGARDS BILL

Hi Trevor!

You can get the latest STiNG from http://sting.atari.org
and the updated CAB.OVL from: http://obooklage.free.fr/sti_cli.htm
(at the last time I checked, the last version was 5.66, but there
could be a new one now! They appear very regularly ;-)

Merry Christmas to all and a Happy New Year!

'just'...

>> > showing DVD on a Milan's screen.
>>
>> Which will just be a case of using a high power gfx card like a Voodoo3 or

The Voodoo3 has no DVD support except for hardware scaling.

>> ATI Rage128 that has on-card hardware MPEG II decoding. Tha transfer of data

The Rage128 has IDCT and motion compensation, but that still leaves quite
a bit of work for the processor (it's certainly a lot better than almost
all other chips, though (some, like the S3 Savage and nVIDIA's GeForce at
least do motion compensation)). For example, that card obviously has no
sound decoding whatsoever.

>> to the card from the DVD drive should be a piece of cake to handle, even for
>> a slower machine...

Unfortunately, that's not necessarily the case.

A friend of mine bought a Hollywood+ hardware DVD decoder board for his PC
and it was completely unusable with a 100 MHz Pentium.
The documentation said that a 233 MHz processor was required...

> hmm, is it THAT easy? I am duly impressed.

It would most definitely not be easy.

It's even possible that you wouldn't be able to get at the necessary
documentation (our attempts at getting hold of information about the
3D hardware on the RageII chip used with the Eclipse have been unsuccessful
so far, for example) and a DVD license (you need to be able to decrypt the
data on the disk after all) is probably not exactly cheap.
(I know the encryption has been cracked, but using that is not really
an option for a company.)

> I just had a thought, though - wouldn't you be able to do that with the
>Eclipse card on the Falcon utilizing a Rage card?

The RageII doesn't do motion compensation or IDCT, so there's no chance of any 68k processor getting close to usable DVD decoding (it does have a rather nice scaling engine, though) with that.

Of course, it would be possible to use a Rage128 (that would require a new device driver (though, probably not all that different)), but I'd be very surprised if there was any way a Falcon could provide the necessary data fast enough even to a dedicated decoder card like the Hollywood+.
I don't know why that card requires a 200+ MHz Pentium, but the Falcon, unfortunately, doesn't even have one tenth of that power.

: traceroute and all three are working fine. But trying lymx or ftp
: no connection is possible. I think I have configured the necessary
: scripts right; I did it the same way as on some Linux boxes before
: and I never run in such a problem before: Either there was no
: connection at all or TCP and UDP were working also.

It does sound strange. Can you quote what error is reported? What about trying something simple like telnet or netcat? Perhaps you could check whether lynx or ftp fails only on your ppp link (but connects ok to your local host) or whether they fail regardless. I had a funny problem at one time which was caused by some erroneous settings for the PPP's MTU and MRU values: perhaps this is another thing to check (best not to specify anything and leave pppd to find a sensible default).

One common feature of ping, nslookup and traceroute is that they don't use TCP, unlike lynx and ftp. Maybe this is some kind of clue.

: connector for external monitors, colour and monochrome. I also remember
: borrowing one for my CLub way back in 80s and it also had the monitor
: connection. Was there a STacy made without and external monitor connection?

As far as I am aware the STacy always had an external monitor connection.
I recall that the external monitor connection would work only with high
resolution monochrome monitors (not colour) but I may be mistaken or
perhaps it was a fault in that particular STacy.

Not all STacys have the mega bus. Ours does not, although a space exists
on the PCB for a megabus connector to be attached. But there is no gap in
the case via which such a connector could be accessed. Although I
understand the STacy's connector is electrically the same as the megabus,
this STacy in fact has a physically different connector, with three rows
of pins (whereas the Mega ST's connector has two rows). Maybe the earlier
models had one that was exactly the same as the Mega ST.

Couple days ago I bought Matrix TC 1006 graphic card for my TT;
everything is fine
except pallete; instead of grey colour (for windows...) I have green
colour.

My TT configuration is:

TOS 3.06 germany
10 MB ST RAM
32 MB TT RAM
250 MB HDD
IBM G54 monitor
Plextor CD-R

I was trying to change pallete with programs included with drivers etc.
but I did not
have any success!

If anyone have expirience with Matrix TC 1006 graphic card, or have
program(s) for
monitor calibrating please, PLEASE let me know!!

The AT-Speed board in my 520ST seems to get its date and time from the
ST clock accessory, which I usually set from a TimeServer using the
neat little Time-setting program that works with STiNG.

Now as to whether the software that I run under AT-Speed are Y2K OK,
I'll find out pretty soon, I guess (although not on 01/01/2000, as I've
just moved and probably won't have them unpacked by then.).

Actually, synching the TT with my Pro Tools equipped Mac via SMPTE would
be foolish since MTC (with song-position pointer) provides greater control
and accurracy. Therefore, I don't need a SMP-II or Unitor. I have found
schematics for C-Lab's ExPort multi-port expander on the www. 64-channels
of MIDI is all I need.

I don't think those formats were around back then, or if they were, they were hardly used by anyone. I believe it will only handle ARC, ARJ, LZH and ZIP files. But it's been a long time, so it's possible that you can tweak it to work with other file formats.

Agreed entirely!

Surfing with CAB displayed on a 29" Sony TV in 15/16 bit colour at a
resolution of 768*576 was -very- nice, and quite fast compared to the
same task done in 256 colours. It seems dither routines for MANY of
the programs we use are quite slow. In particular GEM-view and CAB
IMHO are lacking well-optimised dither routines...

With regard to unpacking JPEG's, if a program existed that could
create a 24-bit Targa image from a JPEG, and use DSP if present
(ie..one that runs on all Atari's), we would see the Falcon just
cream all the Atari's except for the 060 beasties and (maybe) 040?
This is because Targa images are normally uncompressed and the only
processing needed to create one from a JPEG is to unpack the JPEG.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

bummer ... if he's not going to support it anymore (here I've been
telling people he did) then maybe he should release it into PD with
a keyfile that worksforever.

I still own and use it for personnel use from time to time. Don't
need it all that much anymore since the Navy is finally getting e-mail
and I can simply attach the file's to them to sent to/from work/home.
Use to use it alot to send data home to chart on the ST then print out
to a disk file and e-mail it back to work.

No, I haven't heard from Keith.

Why is that dumb? The author of the DOITxxx archives put a LOT of work into these docs, and he only wants to know how many ppl actually use this. So, in an attempt to force you to contact him, he does it like this. All you need to do is mail the author, and you will get the key in your mail. This is how he finds out how many ppl actually use his work, if it is worth working on or not.

So, mail and ask for the key, nothing dumb about that, imho.

4670. 8bit emulator for ST

Newsgroup: comp.sys.atari.st
Date: 1999-12-28 00:00:00 UTC
From: tom.derrick@acpu.com
Message-ID: <946343943@acpu.com>
Source record: 68170

"Frank Gregory" <corvair2@bright.net> asks politely:

C > Can an ST emulate an 8bit Atari with any reliablility? I have
C > a 1040 ST and a bunch of 8 bit computers and limited room. I
C > would love to have the ST be able to run the 8bit stuff. Any
C > suggestions?

There is STXformer, by Darek Mihocka of Emulators, Inc. He says that STXformer is 'dead', but I have several versions of it here. Apparently there is some hardware stuff to do - about connecting a 5.25 floppy drive to the ST, IIRC. I have never done anything with it, so I can't help you there.

Be aware that there is no way on earth to make an emulator act completely like 'the real thing', IMHO. But they can be a lot of fun - the first time I saw 'Welcome to Macintosh' on an ST's screen (Spectre), I knew what 'hog heaven' meant :-)

4672. Why Atari is STILL the best

Newsgroup: comp.sys.atari.st
Date: 1999-12-28 00:00:00 UTC
From: carmel_andrews@my-deja.com
Message-ID: <84aa7b$r06$1@nnrp1.deja.com>
Source record: 68172

The interesting thing I wish to mention, Is that the PC/games console fraternity
(unfortunately I now count myself as one of them, as I also own a playstation and an Amd K6/2 400 64meg, shitty windoze 95 (Atari o/s and TOS are much better,
and I still use and own to this day and that the PC/playstation will never replace
my love fo Atari, PC is too obsolete itself) anyway this PC/games console fraternity
is constantly putting down the Atari format, but what they forget is that a large amnount of the technology the games sonsoles/PC currently uses can
actually be traced back to technology that Atari pioneered, created or were inovators/inventors of, for example, the concept of the 'Plug in and Play' PC, is actually based on the design concept of the original a800/a400 systems
In that these first atari systems featured a removable CPU board/card (a bit like replacing a pentium with a P2 or 3) , a removable personality board/card which contained either a c/gtia and antic and pokey chip (a bit like upgrading existing graphics/sound cards in today's pc's),
crappy o/s (windoze) which is almost as old as the original a800/a400 systems, as windoze/mac os and variants (workbench and tos incl.) are all based on smalltalk from xerox, an o/s or language designed in 1980 by alan kay (ex atari)
PC memory bank switching, originally invented by Atari (according to IBM's patent website)
USB- the latest, hottest, in thing in todays PC scene, isn't just based on the Atari SIO protocol's, but from what I was told was actually patented and designed by the same person (JOE DECUIR- who also designed pokey and the greatest video game ever- and you can forget that crap about sonic, supermario tomb raider or quake they are mere pretenders, I'm talking real computers games like STAR RAIDERS)
Then we have the concept of the removable memory module (also refered to as the 'plug in' memory module) also called simms,dimms and sipps
, again this is based on 2 atari inventions the removable ram cartridge for the vcs, and the modular design of the A800 and A400 memory system, as the a800's plug in memory modules are actually based on the concept from various reserch and development projects from the vcs technology (both the concept of plug in/removable cartriges and prgrammable cartridges and initial stages of research/development into plug in memory modules all came out of Atari's vcs technology, including atari's concept of the custom made chip ie shifter/glue/antic c/gtia/tia pokey, and the technology behind the Jag, Panther and lynx/falcon
I would infact go as far as saying that if it wasn't for Atari, most if

not all of modern
computer and video games hardware technologies would not exist, infact companies like IBM, DELL, COMPAQ, SONY, SEGA and NINTENDO and the rest own a substancial ammount of their success to Atari
I would actually go further and say the if your'e buying sega's, nintendo's, sony's, dell's, compaq's hardware, all your'e actually buying is Atari's technology, or Atari designed technology, manufactured by someone else in someone elses electronic box.. unless you beg to differ

Anyway I can only hope that come the millenium, come's the second coming, Atari that is, and not the late JC
In saying that while atari are still under the ownsership of the crap they call hasbro, you got more chances of seeing the next millenium (1.1.3000), winning the UK national lottery (est. at 14-16 million to one) or seeing humans travel at the speed of light within the next 150 years (186k m/sec), then you have of seeing that crap they call hasbro doing anything positive with atari, Atari a software company, yeah just like Sega manuf's. jeans of nintendo makes soap powder and unilever make tv's... Wake up Hasbro and smell the coffee

Of course you wouldn't need to sync with SMPTE in that situation, though
many friends
have had problems with PT's midi sync, and had to revert to SMPTE.

> Therefore, I don't need a SMP-II or Unitor.

The SMP provides 2 midi ins and 4 midi outs as well, and Unitor2 provides
2/2.
Not only SMPTE. I'm saying the SMP is simply rock solid.
Log3 with Unitor2 gives 5 outs for 6 altogether.

> I have found
> schematics for C-Lab's ExPort multi-port expander on the www. 64-channels
> of MIDI is all I need.

It is my understanding that the timing of Export is not as good as Unitor.
Not sure if would work on the TT.

Which program are you going to use on the TT anyway? Logic or Cubase?

I'm certainly not trying to tell you what to do, but rather trying to
clarify
your intended use.

>
>Are you talking zipper noise or timeline accuracy?

I am referring to absolute resolution. Some sequencers do interpolate
MIDI values beyond the 0 to 127 range. But, interpolation is nothing more
then approximation...which I want to avoid.

>Of course you wouldn't need to sync with SMPTE in that situation, though
>many friends
>have had problems with PT's midi sync, and had to revert to SMPTE.

I have yet to run into such problems. With initial tests of my G3
ProTools synching a collegue's MegaSTe running Notator Logic, MTC worked
as expected.

>It is my understanding that the timing of Export is not as good as Unitor.
>Not sure if would work on the TT.

I've been in contact with Emagic and they tell me that ExPort has the
better timing of the two.

>Which program are you going to use on the TT anyway? Logic or Cubase?

On the TT, I will most definitely use Logic. I currently use Logic Audio
Platinum on my G3, so it is an obvious choice.

4675. Linux and X

Newsgroup: comp.sys.atari.st
Date: 1999-12-28 00:00:00 UTC
From: mlake@melake.erols.com
Message-ID: <slrn86hu6f.nhl.mlake@melake.erols.com>
Source record: 68175

I'm trying to install X on an Atari TT running Linux. I've tried to compile the X source and I've tried just downloading and installing the binary, and with both methods I get the same thing .... when I try to run startx I get "xinit: No such file or directory". The xinit program resides where it should be.

Can someone give me a clue here. Is there a HOWTO or FAQ on installing X somewhere? Or maybe there's a better newsgroup, or a mailing list, for this question?

Thanks.

Atari Games for Sale !!!!!!!

E-mail : oscar@agra.globalnet.co.uk

Work in all ST/STFM/STE Machines.

NOTE : All prices (noted with the symbol #) are in UK pounds
NOTE : All games are original, NOT copies !

** OFFER : Buy #10 pounds worth of gear and get any single game FREE

List of Productivity Software/Hardware : (#7 each + shipping in pound sterling)
---
* STOS Maestro Plus (Hardware Sampling cartridge and software included)

List of Compilations :(#4 each game + shipping in pounds sterling)

** (ALL BOXED + MANUALS + ORIGINAL DISKS) **
* Giants
(includes Outrun, Gaunlet II, 1943 and Street Fighter)
* Quatro Sports
(includes BMX, Italia 90, Advanced Ski and Pro Tennis)

List of Games : (#3 each game + shipping in pound sterling)

(ALL BOXED + MANUALS + DISKS)

* Baal
* Batman
* Deja Vu
* Driller
* F-19 Stealth Fighter
* Falcon (Game + Mission Disk Vol 1)
* Galdregons Domain
* Ghouls 'n' Ghosts
* Gods
* Gold Rush
* Heimdall (1 Meg)
* Hook (1 Meg recommended)
* King's Quest II
* King's Quest III
* Quadralien
* Leader Board (Game + Tournament Disk Vol 1)
* Lotus Esprit Turbo Challenge 2
* Magic Pockets
* Midnight Resistance

* Midwinter
* Navy Seals
* Night Breed
* Operation Wolf
* Premier Manager 2
* Rick Dangerous
* Robinson's Request (1 Meg)
* Shadow of the Beast
* Sly Spy - Secret Agent
* Space Quest II
* Space Quest III
* Spy vs Spy (Artic Antics)
* The Quest for the Time Bird
* Transartica
* Uninvited
* Zool

List of Games : (#2 each game + shipping in pounds sterling)

(NOT BOXED ONLY ORIGINAL DISKS + MANUALS)

* Another World
* King's Quest IV
* Leisure Suit Larry II
* Leisure Suit Larry III
* Operation Stealth
* Police Quest II
* Secret of the Monkey Island
* Storm Master
* Street Fighter II
* The Godfather III (Action Game)

List of Games : (#1 each game + shipping in pounds sterling)

(NOT BOXED, (1)NO MANUALS, (2)ONLY ORIGINAL DISKS)
(1)Manuals are not really needed to play these games anyway
(2)Original Disks, we do not sell pirated software,so don't even ask.

* Alien Syndrome
* Crystals of Arborea
* Hard Drivin'
* Indiana Jones and the Last Crusade (Action Game)
* Oil Mania
* Panza Kick Boxing
* Rock 'n' Roll
* Silk Worm (Boxed but no manual)
* Spitting Image
* Strider
* Trinity
* Trivial Pursuit
* Wrestlemania

Yes DVD-data, but what about DVD-video with copy-protected and region-
code that has to be cheked. Not to speak about the official secrecy
surrounding the keys and decoding of videostreams...
The reason no DVD-video is on Linux: you have to pay 5000 dollars for
the license plus a non-disclosure agreement and the operating system
has to be able to keep decoded data outside reach of users who want
to copy digitally.

Does anybody know if TOS/MinT/magic wil conform to the stringent
prescriptions of the owners of the DVD-video methods?

At least Windows does not but they cannot pass that station...

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

>we may both benefit from the exchange.

I'd like more info as well, though I have some CPXs with which you can set
the variables under TOS.

With MagiC it's done in MAGIC.INF; in the latter case, make sure you
modify the correct one - I spent hours trying to work out why I couldn't
get LED to find its AREAS.BBS file, until Steve Sweet asked which file I
was modifying. I said the one in the GEMSYS\MAGIC\UTILITY\EXTRAS, but as
he pointed out that's a commented example amd I *should* have been
modifying the one in the root of C:\, which somehow I had overlooked.
Once I did that, all was well. For safety's sake I write-protected the
sample one, so that I can't make the same mistake again, I hope!

You live and learn - and I post this in case others can use the tip :-)

Happy New Year to all
/Peter/

4680. Thing/Kobold problem

Newsgroup: comp.sys.atari.st
Date: 1999-12-28 00:00:00 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <84b68n$p99$1@plutonium.compulink.co.uk>
Source record: 68180

I have at last started to get my Falcon with MagiC up and running, but am still having problems with where to save the various *.INF files to.

A strange thing: I have set up Thing as the desktop and to use Kobold when more than 4 files are to be copied or deleted. This works, but for some reason it uses the German texts in Kobold rather than the English ones. There is no problem when running Kobold from the desktop, only when called automatically by Thing. I know that the KOBOLD.PRG file has both languages in it, with the correct one chosen by recognising the TOS language, presumably. But why does this not work from within Thing?

Happy New Year to All
/Peter/

There was Avant, available from System Solutions. I have a demo
dated 1991 with no save function. On the Hades it doesn't show *.IMG
files properly although I think it did on the TT.

I think Arabesque Pro can also do this. Currently available from the
samw supplier (I bought a copy in November).

There is an 8bit emulator on umich, but I doubt it is fast enough on a
stock ST. You'd be better of with a PC emulating both an ST and an 8bit.

4687. Vector Graphics Utilities?

Newsgroup: comp.sys.atari.st
Date: 1999-12-28 00:00:00 UTC
From: jtmartin@gofree.indigo.ie
Message-ID: <vw6a4.2544$J9.1832@news.indigo.ie>
Source record: 68187

Hi all,

I am wondering if there is some utility out there which might carry
out the following:

1) I need to convert vector graphics formats from atari GEM to windows
WMF (also Mac PICT would be helpful). Is there anything
freeware/shareware or even a commercial utility which someone might
like to sell/exchange?

2) I am also looking for an autotracing program (i.e. convert bitmaps
(any format) to GEM metafiles) I know there were some commercial
programs available in the past, but what's available now?

Thanks in advance for any help,

Jerry

Ok, I am having a problem with the DEPACKING then as I am never ever
anywhere near 6-7 seconds with GEMVIEW or CAB. The dithering I understand
and accept. However with GEMVIEW and the JPGD program running, I always
see the ------------- occuring.

So why are my times SLOWER with JPGD loaded then when it is not?
Perhaps you will have to send me your Falcon;-).

>Understandable! If I ever get a Tempest PPC board I'm not looking forward
>to even REMOVING the PowerUp2 board my Falcon has in it...

There is a PPC board coming for the Falcon? See I am in the dark again:-).

>> Off Topic.
>> By the way, one of my heros is a Kiwi who passed away an few years back,
>> named John Britten, who built the Britten motorcycle. I have a tape, that
>> is truly remarkable.

>John Britten lived in my home city, Christchurch. We regarded him as an

>our cars in! To think he could take on the Japanese big boys and win was
>incredible! It is sad that he lost his battle with cancer, and also sad
>I haven't seen one of his bikes race at the local raceway yet!

I figured when I saw your Signature that there could be a chance you were
aware of him. The movie/Documentary of John Britten reaffirms that he was
and eccentric genius. I just decided all kiwis where like him. What is more
incredible is that not only did he beat the Japanese Big boys, The fastest
motorcycle in Racing the last decade has been the DUCATI and he beat them,
with riders of less calibre then the factory Ducati riders.

As I am aware there are only 6 motorcycles of the final prototype, and they were all raced with spectacular results. I haven't heard of anyone racing a Britten now for 2 years as they are worth a fortune to collectors today and racing has a way of destroying a fortunes in a millisecond. The Britten was raced in Canada in its first prototype and WON. Not even the bike that really made him noticed.

Well it is unfortuneate that you haven't seen one raced. Unfortuneately it never seemed like the Britten was racing, until you saw the other motorcycles that where squirming and sliding, trying to maintain the pace.

It should be easy for you to get the tape "One mans Dream", it sums up everything and may be the only way to see the Britten. Pascal Picotte is a friend of mine, and was the Factory Ducati rider, when the Britten pulled alongside him, in the race, and then accellorated past in a large effortless wheelie at Daytona.

Well, that should be enough off topic to make an Atari user Cringe but I have two hobbies and they are Ataris and Motorcycles:-).

Perhaps I am missing a module from GEMVIEW? Perhaps the JPG overlays in CAB aren't being recognised in the module folder. I don't know what is up but it definitely is slower than the TT.

By reducing the Fonts on the Falcon, I at least solved the slow page formatting that the Falcon had. It really wasn't any faster than my ST before. It still isn't that much faster and I am certain, I am overlooking something to obvious.

Later Brian.

>All your tests must be done in the same color modes, otherwise
>dithering comes into play.

Yes, however in 16 colour mode the TT is twice as fast as the Falcon in 16
colour.

> I can tell you that CAB skips dithering
>entirely in all TC modes (15/16/24/32-bit) and makes surfing enjoyable.

Not on a stock Falcon, in 40 columns. However it is faster in True colour,
but see my results, only 11 seconds are saved in True Colour, and this is
still 40 seconds slower than the TT in 16 colour. I do not feel well.

>The depacking is the only thing you have to really wait on, that and
>download time. So surfing with a Falcon in TC mode with the Brainstorm
>depacker setup right,

This is what I am trying to do. Somehow Brainstorms JPGD program isn't
being acknowledged by GEMVIEW or CAB. I am very positive of this. Or else
my DSP doesn't work? This possible?

> should be faster than a TT with a gfx card in TC.

That would be nice. However, if you send me a Graphics card for the TT, I
would be happy to prove you right once again.

>I've never had my Falcon on-line surfing, but I did do some jpeg loading
>tests and the Falcon beats my TT at loading jpegs in TC.

STock Falcon? What version of JPG overlay are you using? Could you email it
to me. Do you have it in the work path or the Module folder. My latest
version of JPGD is 12,25,94 do you have a later one? Do you know of a DSP
test program?

Thanks
Later Brian.

4691. Nethack and Y2k

Newsgroup: comp.sys.atari.st
Date: 1999-12-29 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <84c34m$7eb$1@athena.netset.com>
Source record: 68099

Almost sounds like a joke doesn't it. Well from what I've been
able to ascertain it is not. That is that NetHack is not y2k compliant.

Now my question is does anyone know if the Gem version of Nethack
has this problem? I talked to warwick awhile back and he said someone had
talked to him about the atari code sometime fairly recently. So maybe
this person will know if they are about. I have a message off to warwick
(allison sorry forgot that the first time), but I don't know if he will
have any idea about it's status or not. It has been a few years since
he's used an atari.

The problem is related to save games. I'm not certain to what
extent, but there seems to be a bit of attention being paid to it in the
linux community. Problem basically seems that you will not be able to use
an old save file after the date rollover. There were updates made to the
main nethack core and to it's other variants on other platforms.

So my question is does anyone know if we need it here? And is
there someone out there with a good gcc setup that willing to go into the
code and update it if necessary?

As I said this almost sounds like a prank. But if it is, it's
fooled alot of people.

> N.AES 2, Papyrus or both!

Good Job mario! The comments for the games have not been completely compiled yet, but your games all did very well - if not with points, with positive comments. One of the things I hoped to accomplish with the Comments section of the Vote form was to give authors feedback for their programs. This, on the Atari platform especially, is a prize in itself IMHO. And every entrant got lots of good constructive comments.

And about your prizes, yes you will get both. Infact, to be specific, you will receive:

A Renegade CD, Atari Computing mags, A Radium CD , Latest version of MagiC (mac/pc/milan or Atari) NAES 2.x and papyrus office!

Plus a Web button to put on your page stating "1st place, MGC99!" :)

The complete list of prizes, who won what etc will be online very shortly.

Bengy

4694. Teleprompt software?

I don't know XBoot at all, so regard this as just a pointer.

With SuperBoot, it has a method of tellling if the boot process went through to the end, in the form of an additional auto program which runs last. With this arrangement, you can run SuperBoot before MagiC, so that when MagiC reboots SuperBoot realises it hasn't gone through a full boot process and doesn't run again. According to the docs (from memory, mind), this is deliberately to cater for auto programs which force a reset in this way.

I'm wondering if XBoot has a similar function somewhere which you need to configure as this is obviously a common enough scenario for SuperBoot to have catered for it.

Hi Brian,

>>Photoline and Papillon don't take advantage of the DSP, but Vision does,
>>so I suppose on the Falcon this one should come out tops...
>
>Now I am interested:-). I am surprised Photoline doesn't take advantage of
>the DSP?
No photoline doesn't want anything to do with the DSP, it will take advantage
of the coprocessor if available . A DSP is a number cruncher, so it's very
good at things like depacking JPEG's. However there's more in life then
depacking or packing JPEG's. That's where the coprocessor comes in..the 68882
does a nice job with JPG's but is also used for various functions like
filtering, calculating vectors, ...etc

>I don't even know what Papillon is other than a movie with Paul Newman. <g>.
??? I know a movie called Papillon featuring Steve McQeen... but no Paul
Newman...
Besides being a film it's also a graphic program from ASH. One of it's main
features is the ability to handle animated GIF's.
Oh, there's also a book called Papillon, that's what the film is based on,
great book ...;-)

>>In general Photoline is the best allrounder. It can handle most formats,
>>loads all of them extremely fast and the displayed pic looks good.
>
>How about as an external viewer for CAB? a little bit of overhead, I would
>think. I have actually never tried using external viewers within CAB.
It depends on what you wanna do. When you load a webpage containing JPG or
GIF these will always be displayed *IN* CAB, by CAB. However, when you click
on a thumbnail and you have a external viewer installed, the pic will be
loaded and displayed by the external program... There's no reason why you
shouldn't use Photoline or Vision as external viewer, they'll eat about 200Kb
more memory, but will give you much more options then eg. Gemview.

> CAB 2.8 is
>>very slow but the displayed picture is very good. Draconis Pro is the
>>slowest, the pic looks ugly and in true color mode is not correctly
>>displayed.
>
>I understand CAB being slow. But I am not understanding why my Falcon is so
>much Slower displaying a Picture than the TT. I can only imagine how fast
>the TT is with a graphics card.
Forget the graphic card for a minute...

I suppose you're loading pics on the TT in VGA 16 color mode... are you using the same mode on the Falcon or is it set to 256 colors? AFAIK a Falcon it's overall speed drops quiet a lot in 256 colors. The pic has to be build up in memory, which is slow and keeps the processor busy as well. On a TT the VGA mode doesn't occupy a lot of room, and if you have fast ram it's loaded in there, adding some additional speed.

Now comes the graphic card...
With a graphic card the picture is build in the cards memory, and the cards processor will display the pic lightning fast...
That's the difference with a DSP, the DSP will decrunch the JPEG very fast, but then it's all up to the processor and the slow memory... Try scrolling or zooming a 1600x1200 image, you'll now what a mean...
The ideal combination would be a Falcon with Graphic Card I guess :-)

>What is a good ramdisk program for both the Falcon and the TT?
>I don't need a recoverable one. And if it works good on the ST, that is
>fine too:-).
I recommend MDISK 6.94 works with all Atari's and has some extra nice features and is very reliable. I you run MagiC then go for RAMDISK.XFS, this is a ramdisk with variable size.
Have a look in your mailbox.... ;-)

>>All these tests have been done with a ATI Mach64 graphic card with Nova
>>driver. I suppose that doing the same tests on a Milan II with a ATI
>>Rage II 128 card, will decrease the loading times to less then a second.
>>A mouseclick so to speak...;-)
>
>Bah, you are making me sad. <G>.
Yep, I know what you mean... why don't you follow my exemple? start saving, you've got at least six months left...

Cheers from Belgium
Dennis

Hi

If someone can find out the authors details, wherever they are in the world, I may be interested in continuing support (if possible) for the program etc...

Please use the following address if you are going to reply to this via email. ONLY USE THIS ADDRESS FOR THIS THREAD ONLY.

atari@euphony.net

> test program?

Hi Brian,

I have emailed you a DSP test program which I have on my falcon. (I
have the nemesis board fitted).

I am aware that *my* Nemesis isn't quite what is should be, when I use
any DSP-aware program (CAB/Truimage) under MagiC with Nemesis switched
on, the system freezes. I am using Magic 5.11. I need the higher
system clock to feed my 'need' to have a 800*608 screen ;-) So it's
either high res display, or fast image loading....

Any ideas on this one?

Thanks,

Jerry

Hi Dennis,

Where can I get RAMDISK.XFS. I am interested in trying out the ramdisk
approach to CAB's cache.

Cheers,
Jerry

Many thanks for posting this - I had also been wondering how to get XBOOT
to work with MagiC. I've just done as you suggested and it works well.

I also found it useful to use some SET commands in XBOOT to re-name some
Auto folder PRGs so that I can boot different MagiC set-ups from XBOOT.

Cheers

Paul

4706. Positive Image V.2

With that fact in mind- it is granted that he posts a bit (but
excessively? Not by my reckoning.).
But the problem that he has been posting about isn't funny at all. The
person that Ben is looking for is hammering nails in the Ataris coffin.
Ben is a nice guy that I have gotten parts from on occasion and never
had a problem. Screwing over a nice guy counts as downright EVIL in my
book. He may not have meant it as things do happen, but Ben at least
deserves an explanation. If we don't look out for each other as a
community, who will?

Just my 0.02-

Eric

<snip> Boy this is annoying, is this a special MS service? I find reading Q-funks posts once is enough to make me sick. Is this Bill Gates Secret Weapon? I noticed it repeated the Terry May PC CHOICE twice. I do think it is an EVIL weapon.

Is everybody getting this or is it just me hallucinating. A bad dream, all Q-Funks posts will be sent twice and the second time in HTML courtesy of MS internet exchange.

I haven't found a way around this. If you place XBOOT first, then Magic,
Magic will boot, the reboot bringing you back to Xboot where you would
select your Magic Choice again and then Boot in Magic. If you have Magic
First then you get XBOOT and all choices. When you want to get rid of Magic
however you will end up rebooting twice.
Kind of a vicious circle. I like XBOOT but many Magic users don't even use
a boot Manager.

So no matter how you slice it you get TWO XBOOTS whenever Magic gets
Installed. Thats My Experience.

>Any help or comments are welcome.
>
>Pleace keep in mind that this is not intended to favorise on of these
>two OS's both have there advantages and disadvantages :-)

Glad you have done this. I intend to do the same. Right Now I have Geneva
and Magic on the TT and want to add Mint. Same with my Falcon.

At least you don't have a crazy problem. There is one way I think to avoid
it totally.

Use HD Driver. Set up Magic on one Partition and Mint on another. Then
choose the partition you wish to boot on. I guess Autos and Accs would be
duplicated on each partition, but I could be mistaken as I haven't done
this setup.

Another way is to set up TWO AUTO Folders, AUTO and AUTOX, then run a BATCH
file that loads AUTOX and turns AUTO into AUTOX back and forth. This is
actually how I received my Falcon with 3 Different Auto Folders, X,Y,Z and
set up with NeoCLI. While It is neat, I ended up installing Xboot.

Later Brian.

4715. Strange NG Problem

Newsgroup: comp.sys.atari.st
Date: 1999-12-29 00:00:00 UTC
From: madmax@bfree.on.ca
Message-ID: <sJta4.47$J_1.121@198.235.216.4>
Source record: 68123

I have just noticed something very strange on comp.sys.atari.st and some other NG I am in.

The first case is that I am missing an Entire Thread. What is happening is that two three of four messages will have been posted to the thread and I will have missed them. I only know that they have been posted, because there is a response.

In this Case, since Terry May seems to reply to everything, I am getting all his replies to peoples comments. However I have never seen the original post. Now I thought that this thread was dead. Until the responses started to come. I try to post a reply and my message does not appear in my downloads. I can reply over and over again for one thread and never see the reply, I have no idea if they are going through.

Other threads appear to be alright.

But now this is occurring to me in other NG where the threads become very long.

It would appear like a NEWsie Problem.

I haven't noticed this before with .94 but if someone else has, please let me know. I don't mean just missing a few posts here and there. THis seems to occur to everyone. I mean, where all you can see are the replies to a post, in this case from one person only, and your posts don't appear in the thread. No matter how many times you send them and how much further in the thread you choose to reply.

If Terry May wasn't replying, I would not have seen any posts whatsoever in the thread. It is like everyone in this thread is put into a kill file except for Terry. Did I set it up wrong again:-).

Finally what is with all of Q-FUNKS posts being duplicated in html? One sent in Pine, the next sent by the MS internet Exchange. Seems they just screw everything up. I would like this silliness to end. Can I email someone about this?

It is hardly a benefit to read Martins posts more than once, I never like reading them in the first place.

Later Brian.

The TT has no blitter, so the Falcon may gain some advantage at displaying
the image faster? I really dunno if that would effect results as it
depends on how much the VDI accesses the blitter.

Also the dithering is done by the CPU and not the DSP. The DSP only
depacks so that is why TC modes show big speed differences. Although
the DSP may depack extremely fast on the Falcon the dithering in 16 color
mode will be majorly slow at 16mHz.

I have heard strange stories about bad DSP chips, but I would think it
would completely non-functional if that were the case. Like it would
crash or freeze up? Maybe someone else knows more about that.

> > should be faster than a TT with a gfx card in TC.

I wish it was possible to hand out gfx cards to fellow Atari users,
but I cannot do that. I'll keep playing the lottery in the mean time. ;-)

> test programs?>

All my machines are stock, all I added was RAM and/or FPU's.
It's posted on Flinny's page specifically labeled "DSP version".
Atm I have removed the monitor from my Falcon so I can run 2 monitors
on my TT at the same time. I cannot fetch the OVL or see the version
info, sorry. I do recall it's in the Module path. I don't know of a test
prg but that is a good idea for just such a situation where one is
unsure. Be nice if someone would make such a prg.

4726. Changing FOLDER dates

Newsgroup: comp.sys.atari.st
Date: 1999-12-29 00:00:00 UTC
From: george@moulder77.freeserve.co.uk
Message-ID: <84e35kqej1@newsg1.svr.pol.co.uk>
Source record: 68134

Can anyone tell me if there is a program to change the date of a FOLDER. I know there are plenty of programs to change file dates, but I can't find anything for folders.

The reason? My replacement desktop (Kaosdesk) sorts folders into alphabetic order when files in the directory are sorted by date, which is the default. I like this.

Unfortunately my file selector sorts the folders as well as the files by date, and this can sometimes make it difficult to readily find the one I want.

If I can find a program to easily redate the folders then I can make the date order the same as the alphabetic order, and everything will be sweetness and light, regardless of whether I am looking at a directory or the file selector.

I COULD make a new set of folders in the correct time order and transfer the contents of the original ones over to them (laborious) but this would make it difficult to add a new folder in the right position at a later date.

I'm probably asking this question at the wrong time as all you ST owners are going to find that, in spite of what you believe, your computers will not cope correctly with the year 2000 because only ONE of the two clocks will roll over satisfactorily on December 31st without there being an X-Bios patch to correct this glitch installed in your auto folder; and you will then all be pre-occupied with trying to sort out this problem. The mal-operations you may have with applications after we enter 2000 will most probably be due to the fact that the two clocks are out-of-step rather than with the programs themselves.

A happy new year to you all anyway, and a thank-you in advance to anyone that can help me with my folder problem!

4732. Magic - MiNT boot

Newsgroup: comp.sys.atari.st
Date: 1999-12-29 00:00:00 UTC
From: Karl Samyn <saka@village.uunet.be>
Message-ID: <38694701.33941463@village.uunet.be>
Source record: 68189

hello,

Since a time now, I'm using MagiC and MiNT on my F030. Buth I had some troubles last days with my MiNT-setup.
When switching back to MagiC I constatated this :
I use XBoot on my F030. Every time when I boot in MagiC and want to boot in MiNT on my next reboot, I have to boot twice. This because magicsrc.prg and magxboot.prg are before the xboot.prg. This is done as advised in the Magic Manual. But is this really necesary?
I tried to place the Xboot before everything, but then when I boot MagiC it looks like (it is) xboot is loaded twice...

Any help or comments are welcome.

Pleace keep in mind that this is not intended to favorise on of these two OS's both have there advantages and disadvantages :-)

THX for the help.

Source record: 68191

Hi!

Karl Samyn <saka@village.uunet.be> wrote:
> Any help or comments are welcome.

Make XBoot the first program, create a file called autoexec.bat in your
Auto-folder and write the names of all your Auto folder programs into
it, one per line, but leave magxboot.prg and xboot.prg out. For example,
the file might look like this:

nvdi.prg
blowboot.prg

Only MagiC will look for this file, and, if one is found, only start
those programs listed in it, in the order they appear. If one file does
not exist, it will be silently ignored. Of course, one problem remains:
XBoot will not be run on warm boots with MagiC, only before MagiC is
initially run.

Ciao

Thomas

Have no fear :-) I use TOS, MiNT & Magic whenever it suites me.

MAGICBOOT does only 1 thing: load MAGIC.RAM and then does a soft reset.
MAGIC.RAM commplety replaces TOS, including processing of the complete autofolder.
It knows of course about MAGICBOOT.

Because I have 2 monitors on my TT, I can boot 6 possible configurations.
I have 6 autofolders. The applicable CPX's are in the appropriate auto folder.
I use a little program of myself to switch autofolders. Just drop the auto.xxx
on that program and it changes names.

A 4 autofolder version of that program is on my homepage.

I wanted to use a comparision that the TT could participate in. I use the
TT with CAB in 16colour and the Falcon normally in 256 Colour, so infact
the Falcon would be even slower for what I am using it for.
Watching the ---- bar on Gemview takes more time then the Dithering to 16
or 256 on the Falcon.

>>Picture SIZE Falcon JPGD.PRG TT FALCON no JPGD.PRG
>>
>>1024*652 1.31.0 sec. 43.7 1:30.3
>>640*480 20.3 20.9 45.2
>>297*433 12.8 12.4 28.9
>
>What happens if you are running in TruColor (or the Falcon 64k)?

Well here is your answer. I am only in 40Column mode. TRUE COLOUR

JPGDSP JPGDSP not loaded
1024*652 1:19.7 1:19.5

Like above the picture is loaded faster without the decoder. I am
discovering the same thing with CAB? So 11 seconds have been saved, but it
is still WAY SLOWER than the TT? AARRGGHH, I need to know what I can be
doing wrong. I would have thought without the dithering, I would be under
45 seconds.

Here are the 256colour results which is the mode I use with CAB. Gemview
and Cab seem to have similar display rates, Gemview still appearing
slower, but at least it times everything.

256COLOUR JPGDSP JPGDSP not loaded

1024*652 1:59 1:58.8

Again, with the Encoder not loaded the picture appears fractionally faster.

More ideas please?

Hi Lonny.

I used STeno initially, but it was just a disaster. It would wipe out
my C partition while being installed and editing files on E. I liked STeno
alot, but as soon as I got my internet software set up on my ST it had to
go. I replaced it first with Tempest. Now I use either Edit Plus, or QED,
depending on which machine I grab. I had started to come to the conclusion
that the problem is the result of NEWsie truncating the files.

Yes it is Frustrating.

Solution.

Install Pine. A solution for another day. Too many NEWsie users out
there right now, and I would hope they are having the same problem. This is
something that John should take care of in the near future.

Pine is also not a solution for my ST. Although I would be interested
in knowing if Mint and Mintnet will work on a MegaST4 setup with 60megs to
spare?

Glad to hear Pine is working out for you. Perhaps you may even be able
to edit the text in quotations , instead of quoting the
entire post:-). All set up and running and no time to read the manual?:-).

Thanks for your Help Lonny.

You have confirmed my suspicions.

Later Brian.

Many, many Atari items for sale (clearing out extras,
waiting for Milan II sale!):

Atari TT030 - 4 megs ST Ram, Ajax chip included, 120 meg HD.
(<esc> key on keyboard does not work)

Atari STe - 4 megs, TOS 1.62, stock machine, works fine.

Atari Falcon 030 - Desktopper, Nemesis accelerator, 14 megs of
Ram, 68882 FPU, TT-Touch keys, 2 gig IDE
hard drive, Yamaha 4 x 4 x 16 CDRW.

Will sell continental USA only, money order, does not include
shipping, best offer please.

Hi Bob

No I don't think it's Milan's OS that is the problem, I'm experienced
that Sting and Cab are much more stable than when I was using a STE.
Cab has never locked up my Milan. Are you using Magic or Naes, can
remember which it was? I'm using Naes.

Hi Bob

See my post re Zcontrol but no. Do you mean that the harddisk keeps spinning for a long time? Never more then a couple of seconds on my machine and that is when it has to clear the cache. Btw I have my cache set to 10MB.

Hello,
I want to let you know that in Holland, in the Dutch Atari Egroup, there are 2 Milan users who have had no probs installing Sting + Cab on their Milans, it works perfectly stable. Another guy and myself, however, also Milan users simply can't get this duo working. We have discussed it for over a year now, tried all tips and tricks but without results. On my Milan, for example, in Zcontrol (and Xcontrol), it is impossible to open the Sting CPX. It flashes up for a split second but immediately disappears again.
Fortunately Iconnect + CAB work perfectly and stable under Magic Milan, which I installed recently. The ASH software "Ifusion" allows me to use all the Sting clients with Iconnect so nothing is lost !

Bye,
Dan (Holland)

I don't understand. What do you mean by that? Only non-TOS
programs work?

>The only thing that really annoys me is that I cannot use the DSP and Nemesis
>at the same time!!!

You can't anyway. Nemesis isn't a processor, it's (primarily)
a clock generator circuit which provides uprated timing
reference signals to the existing Falcon components which *are*
responsible for program execution: CPU, FPU, DSP...

It's called "Zero-X" and is a professional sample and groove
editor. Like all professional software, it has the potential
to earn back your investment many times over, and fools who
ask for cracks only show themselves for what they are:
incompetent amateurs with no ideas.

You know, it's interesting.

I don't have my Atari hardware any more, but I'm staying up to date via this
ng, emulators, a user group, etc. I've never bought anything from Ben, but
I'd be tempted to give him a try if I ever needed anything. His posts are
informative, and, IMHO, nowhere near excessive. They don't have "caveat
emptor" screaming at you like some other posts I've seen.

The community is small but deserves to live on -- with a minimum of dispute
and hard feelings.

So now there's $.04 in the pot!

Hi All,

My Nemesis (fitted by Doug Little) is very happy when I am using a VGA
monitor, but does not work at all if I switch to an RGB display - my Falcon
will just not boot up !!
It is not a conflict of Auto programmes either as I have tried with nothing
but the Nemesis stuff in there and all accessories disabled :-((

DC>
DC> or similar - most modern progs will save their inf files in there, or inside
DC> a folder in that path which they will create themselves.

The problem I have found when I have defined a "Home" folder in my
MAGX.INF file, is that AFTP cannot find its information files at all,
and comes up with all sorts of wierd defaults and no idea of what
sites I have stored. I started copying AFTP's .INF files all over the
place, but it never could find them.

Removing (actually, commenting out) the #_ENV HOME line in my MAGX.INF
file fixed this problem and I have not encountered any adverse effects
in any other programs.

TT with 4+16 megs of ram, Magic 6.01, NVDI 5.03, Thing 1.27. Latest
AFTP etc.

Thanks, I'll have to give that one a try (I'm a Cubase Audio user).

>Any more ideas ? This way we can enjoy our millenium tips and leave
>others to worry about millenium bugs :-))

** In CAB:

Hold CONTROL, left click and drag the URL button to an open [text]
editor window to quickly copy the URL there.

** In NEWSie:

When using ftp, single click (highlight) a TXT file (usually .DSC, or
.UPL), then hit "v" on the keyboard to view the file while remaining
within NEWSie/ftp (it opens in it's own little window).

I don't know if it's my ISP or NEWSie, but lately I'm having to post my
messages more than once for them to show up in the group (very annoying!).

Anyway, here's the important part of a previous post by me that apparently
never made it to the server:

Make sure you add the following lines to your STinG "DEFAULT.CFG" file:

BROWSER = E:\CAB.27\CAB.APP
MAILER = J:\NEWSIE\NEWSIE.PRG

(of course, substitute the appropriate paths/directories for your own).

It should work then.

> programs work?
No - Under plain TOS (no accs, no auto folder programs) when I switch on
Nemesis, the computer freezes!

When I use MagiC, I can switch on Nemesis, in LO speed, and it works!! (Very
strange). Switching to HI does not yield any further speed increase.

> >The only thing that really annoys me is that I cannot use the DSP and
Nemesis > >at the same time!!!

You mistook what I meant by this :)
Yes, I can use Nemesis to speed up the computer under Magic; however in the
majority of cases - when I try to do any DSP task (TruImage 030, JPEGD etc.)
the computer freezes. If I switch off Nemesis, I can use the DSP reliably for
these tasks. This freezing appears to be totally random. Sometimes happening
all the time, other times not at all. As a result, as I prefer the larger
screen resolution, I am forced to use the ordinary ST versions of TruImage and
the CAB JPEG.OVL

Make any more sense? I know the Nemesis problem has me baffled, but I believe
that it is a faulty installation...

I only had the .RTF version of the nemesis manual, but I had some time on my
hands and had a look around inside my machine. This is what I found:

Everything is as described in the Nemesis manual except for two black
wires at the top right of the Nemesis board (as viewed from the front
of the falcon). The 'THICK BLACK WIRE' is connected to the ground rail,
although the manual says it should be connected to the negative pole of
the 4700uF capacitor. This may not be too much of a problem, but the
'THIN BLACK WIRE' is also connected to the ground rail. This is
required for the testing of the Keyboard patch, however later (chapter
9 of the manual) this wire should be connected to pin 5 of the MIDI
chip. This pin of the MIDI has not been connected to anything, and the
thin black wire remains (shortened) and connected to the ground rail.
At the end of 9.1 - the testing of the Nemesis speeds, there is
reference that problems with the THIN BLACK WIRE might lead to Nemesis
only being able to run in low speed (sounds familiar...)

Do you know if the above description of the Nemesis installation could be responsible for my problems? Also is it simply a matter of connecting that black wire to pin 5 of the MIDI? I have no electronics experience whatsoever, but if it as simple as this, I could get someone to have a look at it.

Hi Brian

>So no matter how you slice it you get TWO XBOOTS whenever Magic gets Installed. Thats
>My Experience.

You need MAGIC_XB then, its runs after Xboot, susses out if MAGX is installed, if it is it will not allow a run of xboot a second time.

Here's a clip of the credits in the prog.

13.03.1997 MAGIC-XB Version vom 1996/1997 by Volker Janzen FREEWARE

I Cannot remember where i got it!! This might help with a web search. Actually as i type i seem to recall it might be on a CD ive got, if anyone needs it then drop me an e-mail and i'l look it out.

steve@sweet3.freeserve.co.uk

There are a few things detailed in the Quick FAQ. Yes, an ST can use
1.44M disks, but there is an additionnal circuit to be built and
connected to the original floppy controller.

>strange). Switching to HI does not yield any further speed increase.

If I recall correctly, LO and HI corresponds to 40 and 48 or 50MHz
respectively, yes? If so, such a relatively small difference would
be difficult to subjectively measure, you'd need a benchmarking
utility to be more accurate.

Can't help you there, as I don't use a Nemesis.

In general, DSP problems on an accelerated Falcon tend to
be caused by disturbance of the enhanced DSP clock signal
(coming from a length of wire that can run anywhere within the
Falcon case, it's prone to picking up RF noise quite easily),
and/or faulty DSP SRAM (or intermittent solder joints between

the chips and SMD pads).

Best thing to do is consult with the person who fitted it.

?

>In that these first atari systems featured a removable CPU board/card (a
>bit like replacing a pentium with a P2 or 3) ,

Removable CPU board? Are you very sure of this?? I can only
speak for the 800XL I own, which has all chips either
socketed if not certainly soldered direct to the motherboard.
I can't think of any good technical reason to have these
chips on daughterboards, especially back in those days, and
I've studied the internals of quite a few "classic" computers.
In the '70s and early '80s, CPU development was nowhere near
the relentless pace it's at now, what would have been the
point of mounting the 8-bit Ataris' CPUs on daughterboards?

>a removable personality
>board/card which contained either a c/gtia and antic and pokey chip (a
>bit like upgrading existing graphics/sound cards in today's pc's),

GTIA was the successor to CTIA, there were no more
released (or otherwise, to the best of my knowledge)
original 8-bit Atari graphics chip developments after
GTIA, and again, I've never seen or heard of these being
on daughterboards, and I think you're wrong to assume
Atari pioneered the concept of daughterboards. You'll
find, in fact, a lot of domestic electromechanical
system construction concepts actually filter down from
industrial designs, which often demand that flexibility.
The same statement can actually be applied to a much
broader range of products. Many of the things we use in
the home and now take for granted were originally from
industrial or military technology (computers and the
internet being prime examples of this).

I'm not aware of any other sound chip in the 8-bit Ataris
other than POKEY. I've owned an 800XL since 1985 and never
in that time ever heard my peers raving about the latest
wavetable, multi-channel I/O, high-resolution sampling
replacement sound chip for the POKEY.

>USB- the latest, hottest, in thing in todays PC scene, isn't just based
>on the Atari SIO protocol's, but from what I was told was actually
>patented and designed by the same person (JOE DECUIR- who also designed
>pokey and the greatest video game ever- and you can forget that crap

That's crazy. People do move on and take their expertise
with them - you can't say a particular technology can be
traced back to Atari just because it happens to be conceived
by an ex-Atari employee!

People are what make a company, and a great company has a
management which is good at keeping and harnessing that
important resource. Atari had a strong team of visionaries
during its heyday, but lost most of them due to one reason
or another, usually lack of appreciation for its in-house
talent. Look at the number of companies and bright
individuals which left Atari and went on to bigger success:
Steve Jobs and Steve Wozniak (Apple Computer), Activision
Software, some of the original 8-bit Atari designers left
to form Amiga Corporation (three guesses what came out of
that, apart from some weird game input devices...), the list
is quite comprehensive.

You are right, however, that Atari as a company did have
many innovations in its time, and once had some of the best
lawyers in the business, to help protect those.

Incidentally, I thought the designer of POKEY was
Doug Neubauer (sp?).

>Then we have the concept of the removable memory module (also refered to
>as the 'plug in' memory module) also called simms,dimms and sipps

The concept of modularity in electronics is not an Atari
invention at all! I'm even sure we would still have had
Atari, SIMMs, DIMMs and SIPPs even if the Romans and
ancient Egyptians didn't use modular building materials.

>, again this is based on 2 atari inventions the removable ram cartridge
>for the vcs,

Couldn't you, in the same way, say that this in itself was
based on the earlier invention of interchangeable magnetic
tape?? (Open reel-to-reel, or domestic Compact Cassette,
from Philips, in the '60s)

>and the modular design of the A800 and A400 memory system,
>as the a800's plug in memory modules are actually based on the concept

Again, I can only speak for my 800XL, where all the RAM
chips are soldered on, and again, I can't see any reason
why the 400 and 800 would have memory on daughterboards.
Those machines were incredibly expensive at the time,
and using modular memory would have made no sense in terms
of cost. Of course, that could also depend on your definition
of modular. A semiconductor RAM chip, packaged in a ceramic
or plastic carrier with pins, can be considered a modular
unit, whether soldered to a PCB or seated in a socket.

>from various reserch and development projects from the vcs technology
>(both the concept of plug in/removable cartriges and prgrammable
>cartridges and initial stages of research/development into plug in
>memory modules all came out of Atari's vcs technology, including atari's
>concept of the custom made chip ie shifter/glue/antic c/gtia/tia pokey,
>and the technology behind the Jag, Panther and lynx/falcon

Jaguar was developed by some guys in the UK. Atari did that
with a lot of products. Saw something nice, and either
funded further development and/or branded it. Some examples:
ATW800 (Atari Transputer Workstation, an Inmos processor
farm originally conceived by some UK guys in Cambridge),
Portfolio pocket PC (originally the DIP Organiser), Lynx
hand-held games console (by ex-Amiga guys; does anyone
remember the 1992 5th International 16-bit Computer Show
at the Wembley Exhibition Centre in the UK? Atari had by far
the biggest and best stand, which really made the trip
worthwhile, and it also had a Lynx on display connected up to
an Amiga development system).

>I would infact go as far as saying that if it wasn't for Atari, most if
>not all of modern
>computer and video games hardware technologies would not exist, infact
>companies like IBM, DELL, COMPAQ, SONY, SEGA and NINTENDO and the rest

>nintendo's, sony's, dell's, compaq's hardware, all your'e actually
>buying is Atari's technology, or Atari designed technology, manufactured
>by someone else in someone elses electronic box.. unless you beg to
>differ

It doesn't take a very smart engineer to realise that if a
chip design (or anything else, for that matter) isn't available
off the shelf, he/she must create it from scratch.

The physical technology was around for some time before Atari,
but Atari had a skill of making it into something just that
bit better, more fun to use and usually at a better price than
the rest (how many other 8-bit computers could match the colour
palette, graphic mode flexibility and sound of the 8-bit Ataris?).

How do you attribute the PlayStation's Geometry Transform Engine
to Atari? Besides powerful marketing, this chip was the core of

PlayStation's success. It happened to do something very exciting, much better than just about anything else available for a similar or even substantially higher price (business survival instinct drives this).

If Atari could have kept up its pace of originating that kind of technology, the Jaguar wouldn't have bombed so early (although up against products and marketing from the likes of Sony, that was more or less inevitable).

>In saying that while atari are still under the ownsership of the crap
>they call hasbro, you got more chances of seeing the next millenium

Has anyone actually logged on to www.atari.com? It's weird. They actually have an "Atari Community" discussion forum, where people just... talk Atari, and the good old days. It seems a nice pleasant group, yet somehow another world from c.s.a.st here. Someone at Hasbro obviously acknowledges the existence of a hardcore following and community spirit left in the Atari scene, I just wonder how long they can go on, re-hashing age-old games (many of which were, admittedly, truly excellent) instead of actually looking at how games used to be conceived and then taking that ethos to develop yet more really innovative games.

4762. PlayStation Power and Atari logo

Newsgroup: comp.sys.atari.st
Date: 1999-12-30 00:00:00 UTC
From: lais@zetnet.co.uk
Message-ID: <386be548$0$159@news.zetnet.co.uk>
Source record: 68019

Does anyone here, apart from Kevin Jones, have one
of those freebie Atari bags given away with the
current issue of (UK-based) PlayStation Power magazine?
I went to buy a copy today, only to be disappointed
when I saw it on the shelf - it's not the original
Atari logo, but the horrible modified one that Hasbro
now uses.

I don't know why Hasbro did this. Maybe to make it
more "trendy" or perhaps for legal reasons. Whatever,
it's a travesty of the original design. The curvature
of the two sides of the Mount Fuji stylization has
been slightly straightened, and the whole thing
enclosed in a round-cornered box. The "ATARI" writing
has also been slightly warped out of proportion and
it has all lost its very fine balance and form.

The original Atari and Fuji logo is not exactly complex,
but if not correctly proportioned, looks really cheap
and nasty (and I know from trying, without knowing the
correct proportions, how difficult it is to construct
even with professional drawing tools). That's exactly
what the Hasbro version looks like, in my opinion.
They've ruined a timeless classic. Does anyone else feel
that the Atari logo always looked fresh and up-to-date
on each and every new product Atari made?

Needless to say, I didn't buy the magazine.

A few years ago, one UK company produced some excellent
Atari T-shirts which were sold in big (and small) record
stores all over the country. The logo was a perfect
reproduction, with classy choice of colours, and I foolishly
didn't buy one.

While on the subject, has anyone noticed that the German
division of Atari always used a heavier weight for the
lettering of "ATARI" itself? You only have to look at
Atari GmbH's PR material to see this. On the UK stuff, and
on the badges of the machines themselves (including the
Lynx, various pocket and desktop calculators, and the
USA-made Jaguar), you can see a gap where the "R" of ATARI
"folds-back" on itself, but the Germans made it noticeably
heavier (somehow it always made me think of chunky,
delicious German sausages), such that this gap was closed.

To me, that was the give-away sign (apart from the obvious) that an Atari document or graphic design had originated from Germany. The one exception I can name, surprisingly, is the double A4 (folded A3) colour brochure about the Falcon, where the "slim-line" Atari lettering was used.

I have a comprehensive collection of absolutely beautiful Atari GmbH press photography here, it's all classic black and white and includes a broad range of products, and the construction site of Atari GmbH itself. If anyone is interested, I'll try to find time to do high-quality scans of these and put them on CD-R or on-line.

I've just been reading my way through an Emulator FAQ at
http://members.aol.com/rg1004/atstemu.faq.html which gives some ideas, and
URLs (which I haven't had time to try yet).

I'm looking for the same thing..an ST emulator I can use on an old 486DX to
develop software for an ST520 that I've just bought.

Does anyone know of a good free programming environment (Basic or Pascal
prefered) for the ST?

Thanks

Paul Cull

Actually, some of the links in that FAQ are old. The Little Green Desktop at
http://www.pacifist.fatal-design.com/ is probably the best place to start an
emulator pilgramage, IMHO.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

NOW! For a limited time offer! Buy an Atari ST Computer and receive, your choice, for ***FREE*** an ST Color or MonoChrome Monitor. That's right, you too can have a Color or MonoChrome Monitor, made by Atari when you buy an Atari ST Computer. Thats an SC1224 or an SM124 Monitor. Customer pays shipping. While supplies last.

(Update: 12/23/99) I've just bought a bunch of ST Software titles from a distributor. Almost ALL of these copies are Brand New copies. By +NEW I mean either Factory Packaging, ShrinkWrapped, UnOpened or UnUsed. I must of received over 60 new Titles. Most of these titles I only have 1 or 2 copies of each. Many of which my competitors don't have. First come, First serve. I've included in this NewsGroup posting the List of ST Software I've added to my catalog. This list is down below past all the rest of the text. In my Software catalogs, NEW Software (As opposed to used.) I have in it's listing "+NEW".

(Update: 12/17/99) I'm calling on my regular and repeat customers for help. This is a slow time of year for me. I've had customers start on orders and either cancel or postpone their order because they needed to use their Money for the Holiday. Regardless, I have bills that are being neglected & debts to pay. That's why I'm counting on my Customers to help me make a living. Currently I have a bunch of new ST Software come in. Both New and used. I just need time to process the new inventory. So keep an eye on my Catalogs to find what's new.

e-mail: atari@benjamin.net

I invite you to call me for better service. My hours are different from most people. You can can call me anytime to leave a message, but if you want to speak to me directly, my hours are (usually) from 6 P.M.-5 A.M. Pacific Standard Time. Also I'm available from 10 P.M. Sunday Night-3 A.M. Early Tuesday Morning. To sell to a Customer, He/She must be able to E-Mail me. Still, I believe a phone call can do the work of 100 E-Mails. Especially if things get bogged down. If you call and I'm not their, please leave a message stating what you want and a phone number that I can call you back at the hours listed above. Pacific Standard Time. Call (503)256-9974, and if you can't call me Today, Call me Tomorrow.

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit & Atari ST! And remember, if you can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, January 13th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. We're trying to rebuild our club so we're looking for Atarians who wan't to get involved in supporting other Atarians. If your interested, call Ben at (503)256-9974 and by all means, come to our meetings on the 2nd Thursday of the Month. For more info, surf the Web@

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

You should know I regularly add more Atari stock items to my catalogs and this weekend is no exception. A list of my new ST Software I just added to my Catalog are listed below. In case your wondering why my Catalogs (below) are formatted to 38 Columns. They are made to be compatible with the lowest common denominator. Also known as the Atari 8 Bit. Once the Classic Atari User converts the Carriage Returns to

Atari 8 Bit.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

e-mail: atari@benjamin.net

I'm looking for the author of some Atari SoftWare and I could use your
help. He's one of the Authors of FreeZe Dried Terminal, He's the Author
of UBBS and ForeSight BBS Software and his Software Company is called
FreeZe Dried Software. His name is Brian G Hauer. I'm a registered user
of some of His Software. On top of that, I recently sent Him a bunch of
Atari Jaguar Hardware & Games & a 7 CD Changer CD ROM. I was expecting
to receive extra & special support. Instead, soon afterwards He dropped
support of my Software. Now, I'm not asking for a refund or a return of
the extra stuff I sent Him. Still, I would like to receive the support
and special attention I'm entitled to. Brian G Hauer lived/lives in
California. His Parents/Family still do. His parents Phone is in the
(310) area code. Nobody there returns my Phone calls & the only answer
I get is their Answering Machine. Last I heard, Brian was getting His
College/or better Education in California. I'm guessing USC/UCLA. I
would appreciate information such as an E-Mail Address, Phone Number or
even an Address. Please, if someone out their knows Brian or knows His
whereabouts. Please E-Mail me or call me at: (503)256-9974. And Brian,
if your reading this, E-Mail me at: atari@benjamin.net or please call
me!

e-mail: atari@benjamin.net

Please direct all replies through E-Mail at bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I don't regularly check NewsGroups.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, January 13th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. Get together with other Atarians. Make friends, meet new people, maybe find an old friend. Eat Pizza, drink Pop or Beer in a decorative atmosphere. Bring your family to a family friendly place. For more info try:

http://pac.pdxweb.net

4776. Re: ColorBurst Hand Scanner for TT/Falc

Newsgroup: comp.sys.atari.st
Date: 1999-12-30 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <386ac5a6@athene.hdm-stuttgart.de>
Source record: 68047

Hi John,

Yes the Falcons Cart Port is a Strange one.
I've often wondered if some type of hardware modification could be done
to make it Compatible with the ST Cart port for things like the GCR cart.

I have a ColorBurst Falcon Hand Scanner.
The ColorBurst Hand Scanner for the Falcon connects to the Printer
Port. It doesn't use the Cartridge Port at all.

Maybe the version for the TT does use the cartridge port??

I was reading thru some older Atari magazines, catalogs and etc
and saw an advertisement for TT and Falcon versions. And was curious
about the TT version. I didn't know that there was a TT version even
made.

The Falcon version will Scan in 18 Bit Color (262,144 colors) With Images
being saved as 24-Bit. Also does 12 Bit Color (4096 colors) and
Grey Scales and a Text Mode. There are 2 Scanning programs, One for
True Color Mode and one for 256 Color Mode.
It's a nice looking scanner and does a decent job. Biggest let down is
that there are no editing/drawing/Text features other than Clipping
the Scans. It does support the TGA format which can be loaded into lots
of Graphics/Paint packages for Editing thank goodness!

I believe the highest Color Mode on the TT is a 256 color mode.
So I'd think that the software would be different. Maybe the TT version
supports sometype of Graphic Cards?? Anyone have the TT version that
could post/e-mail some details.

Also, I've been looking for a Graphics/Paint package for the Falcon
called CHAGALL. I'm not sure, but this program may have went shareware?

Anyway I was reading a review of it in ST Format and it suppose to have
Scanning Support for the ColorBurst Falcon Hand Scanner. Does anyone
know for sure if it does or not? Also any details where I can find a
New or Used version of CHAGALL for sale/trade, then do let me know.

On one of my Falcons, I have had problems printing with the BIOS
option as well. I think it occured after I upgraded with the patch
from the Behin Brothers web page, but NVDI prints fine from my sons
machine. Both have NVDI 5.01 installed. I will have to look into it a
little more. There are a couple of ImageCopy upgrades available if
you have a current version, and each acts a little differently than
the other I have found, one topic being the ability to save a JPG
file.
My soldering iron is hot now, so it will be a while......

It does take a little messin around with. If you "know" for sure the output is what you want, I found it best to print to a file, then I can send it to the printer at a later time. It is pretty slow, but my Quadra 50Mhz 040 is no faster. Full color prints from a PC is pretty fast however (that is if windows can manage to printer to the printer).

I have the Field Service Manual, but the pages are much to big to copy or even worse to scan so they can be read. Best deal, if your a die hard Falcon owner is to purchase a copy of the manual. I think Robert has much information in his archive, so that would be a good place to start, or just as questions here.

Hi Jerry. I too, have had quite a few problems getting my Nemesis
equipped Falcon "just right". My particular problem is that I can't
run a few programs in Nemesis HI. I can run just about everything in
Nemesis LO. I have a 68882 (33mhz) as well. I can't run CAB or even
CoNnect in HI. Both run fine in LO. My problem seems to be memory
related. I went through 2 mem. boards before I found one that is
sort of useable (single 72-pin SIMM, 16 megs, 60ns). I still get
some artifacting in HI. Oh well, its still that much quicker than
a stock Falcon, even in LO.

Did you have memory problems? If not, what board are you using?

Catch ya later.

PS I'm running an 800 x 592 x 256 color screen right now. Can't
do TC though, curse the luck. That would be way-coo! ;-)

Wait I may of made a mistake! I am sure it does not go left to right
it either pops on or not at all like you said. I don't use the Falcon
much I must admit since I'm not into music like most. It's basically
used only for some apps/demos that require DSP. ;-)

This may not be much help but on the Falcon you just pop it in.
Simple as that. Do you have some prg/cpx to look in the cookie
jar? Soon as I put the FPU in the Falcon a new '_FPU' cookie appeared.

I had a similiar problem with long threads. Turned out to be that the
editor I selected for editing could not cope with the long <ref>
lines and they were getting truncated. So I'd reply, newsie "seemed" to
post them but they never appeared. It was not posting them at all due
to the truncated ref line I assume, however it was also not returning
any error msg either. Frustrating to say the least! This had me puzzled
for sometime.

Solution? I installed PINE, but then I am already running MiNTnet.
I had been using STeno as the editor and perhaps QED would of solved it
but after being told the simplicity of PINE I took that route.

Maybe I've shed some light on your problem? Hope you see this post... ;-)

Sometimes the FPU doesn't work right with the bus accelerated. I had
to supply a seperate clock to the FPU for it to work with the Nemesis
and Mighty Sonic. It took some trial and error with different clocks.
If you follow the trace to the FPU clock in, it ties in with the DMA
clock near the DMA in as well as where the buffer mod inputs the
clock. Bad.
The FPU clock in trace under the socket, AFAIK,
is burried somewhere inside the PCB, so I found the easiest way is to
lift the FPU clock pin where it can rest atop the socket, and supply a new
clock there. It's a touchy thing as the leg breaks off easily.....

I haven't changed anything in ages, except for this upgrade to
iso-8859-15 a few weeks ago.

> If it is the above problem, then is it my ISP or my NEWSERVER
> which is WORLDLINX?

That, I really couldn't say.

> Strangely enough I have had A LOT of Problems in the last
> week see .ST thread.

The question is, are you the only one having these problems?

> So, who is sending it in HTML, I guess is the question.

Pine always composes in plain text, using Pico. It also stripes
any HTML, when replying to an HTML message. That's what I use.

Falcon have the same port as all other atari computers.
Some signals of the falcon port are generatet by combo and the timing is
faster. Maybee thatï¿½s the problem if some older cardridges wonï¿½t work
correctly. Rest is all the same. Isnï¿½t a problem of the cardridge,
mainly software sould fix the port trouble. Older port routines based on
st timing.

Years ago i used an hand 400dpi s/w scanner from printTechnik with rom
port interface. Hardware works perfektly but not the software. Must take
another scanner software for the falcon.

The demo is compiled without the "disabled" functions
anyway, so no amount of cracking will get them back. If you
need to use the program why not buy it? Don't say all that
rubbish about not being able to afford it. If you can't
afford it, do without. If you don't think it's worth it,
why even bother?

On second thought, the culprit must be some intermediate point in
the news delivery chain that uses Microshit as their newsserver
and never upgraded it to a version that recognizes iso-8859-15.
It also presumably sends all its warnings in HTML by default,
including rejection messages (i.e. bounces) and other warnings.

Well, I can't get Nemesis to run in HI at all!!! Selecting high yields the same speed as LO. Also, I found that Nemesis would not run under TOS at all! I purchased my system ready set up from Titan (Cortex) but they had some problems with the nemesis installation.

I discovered though that using a CPX to switch off the blitter chip under TOS allowed Nemesis to run, though only in LO speed also. Looking through the Nemesis manual (I only have the disc based one) it seems that there is a stage in the installation which yields this effect, of the high speed not being available. I have never really had the time (or the guts!) to go messing around to see if I could get a better result.

The only thing that really annoys me is that I cannot use the DSP and Nemesis at the same time!!!

> Did you have memory problems? If not, what board are you using?
I never had memory problems, although as I said, my machine was outfitted by Cortex. It has a single 72pin 16MB SIMM.

> PS I'm running an 800 x 592 x 256 color screen right now. Can't

I was running in 256 also, but the screen redraws were painfully slow, even with NVDI (well, after using 16 colours for some time now, I could never go back.. ;-) I switch to the 256 for image editing etc if needed. Funny, I could never do TC either!!! HI speed is really needed for that!

Hi again Derryck,

have done what you and others have suggested, and (for the moment) all seems stable on the retention of speed and handshaking fronts. I still get the impression that CAB and/or the overlays and/or Sting are not comfortable with the Milan OS. I am getting much more lock ups than with the Falcon. Another thing with the Milan is that when the 'Resolving URL' has to kick in, there is a great deal of HD accessing and a long delay before a page is completed. I am not grumbling, as it would be a miracle if everything about the Milan OS were 100% compat. with CAB etc. Still, if the new Milan and/or Magic have a dedicated Browser, then, fantastic.

All the best,

Bob.

Hi Michael,

In my innocence, I assumed that as Z follows X, that ZControl was an
improved version of XControl.
It's little snippets of info. like yours that make this NG worth its
weight in gold.

All the best for 2000,

Bob King.

Hi Jorgen,

See my post to Derryck, re the HD accessing when CAB/Sting has to do
some 'Resolving' of host names, I think within (ie links) a page being
loaded. Do you also get this on your Milan.

All the best

Bob King

Hi Terry,

Re. CAB loading JPGs. There are a few JPGs on the 'Net, that only CAB seems to load, every other prog. including Gemview, Fastcopy, AniPlayer, Apex, refuse. The most I get is that the ID is 0C and not acceptable. I have tried changing the ID to 0D, the JPG is then accepted but shows as rubbish. It seems stange that dedicated viewers fall over whilst a Browser and/or its OVL succeed.

Bob King.

It would appear that Martins Latin Character set is not friendly to the NEWSERVERS. Will find out later. I just started a discussion with Q-FUNK on Advocacy and I think it is more appropriate in this NG.

Later Brian.

Another holiday project conquered. I have GS up and running and
showing me the latest Speedvision calendar.

Lowest priority on my list. Easiest fix. Thanks to all who offered
their advice. I did change GS from a GTP to APP. Then I got the error
message in a window so small I couldn't read the error:-). But I figured it
must be in the cfg as was pointed out to me. Sure enough the cft was
incorrect.

I changed the partitions but one folder unlzhed in a different format I
didn't catch. So mine looked like this F:/GS/PS/
Whereas the cfg read F:/GS/ps.550/

Simple error.

Sometimes the hardest to catch.

Thanks again.

Later Brian.

I am pleased to report that I now have the Falcon with its DSP functions performing as advertised in CAB. I had a CABJPG.OVL that was very current with a file size of about 89K, and replaced it with the older JPG ovl from 1996. It is about 22K in size. I don't know if this will cause problems with other jpg pics but so far so good.

The JPG Picture that was taking nearly 1:30 to display in CAB in 256 colour is down to 29seconds. This is more acceptable. This same picture with the DSP.ACC program loads in 7.9 seconds. In CAB in TRUE COLOUR it loads in 11.Seconds which is about 4 times faster than the TT in 640*480*16.

So this older JPGOVL is roughly 3 times faster than the one that comes in the CAB 2.7 demo package? Any Ideas?

Between the Fonts loading, running Geneva, and CAB just plodding along, I can 100% verify that it was just barely faster than my ST. This should no longer be the case. However online testing is yet to be done. So you may here from me yet.

I have not yet resolved the GEMVIEW DSP situation, however, and would still like to get this resolved.

I want to thank everyone who helped me. Jerry for sending me the DSP utilities and putting my mind to rest.

Thanks Again, Brian.

BTW, the only thing Dennis sent me in the mail was a cold:-). Cough, hack, cough, cough, I am sick, but a happy sick.

Brian.

The Atari Compendium seems to be the best place to look for this sort of info, however TBH unless you're programming, it's more a question of knowing what info to put into the environment setting file (see relevant program info), and what to use to actually set it that really matters. For the latter, there's a utility in the Sozobon C programming distribution which is possibly the best bet if you aren't using MagiC and its magx.inf file.

Let your software decide where to save them to.

Your magx.inf file should have a "home" statement:

#_ENV HOME=C:\USER\

or similar - most modern progs will save their inf files in there, or
inside a folder in that path which they will create themselves.

4822. emulators - GEM2000? - ST utility for TOS on disk

Newsgroup: comp.sys.atari.st
Date: 1999-12-30 00:00:00 UTC
From: Mustafa Soysal <test@umich.edu>
Message-ID: <1iLa4.4104$b5.680316@news.itd.umich.edu>
Source record: 68093
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.atari.programmer

Greetings,

I am looking for emulation packages that run on W98/NT4. In particular, I am looking into running it on a W98 laptop.

GEM2000 by Emulators, Inc. seems to require either a hardware extension with the TOS ROM's plugged in, or the TOS images on disk. For laptops, they recommend the disk image.

Are there any TOS utilities to extract the TOS image from the ROM? I don't know which version it will be, we have several different ones we may have to try.

What are the image requirements (Lo, Hi, headers etc?) I may be able to write such program (I forgot if the ST let you access the ROM contents without giving you an access exception - and I also don't know what address the ROM started and where it ended). Information would be very appreciated.

If you were looking for an archive, which ftp site would you look at these days?

Help is greatly appreciated.

Best Regards,

Mustafa Soysal

Since I haven't run into this, I can only speculate. But if you are replying while online and are still connected to your IP, when your NEWS SERVER disconnects, can you not finish your message, then it should queu up for when you reconnect. Um, better think this out, this may not be available in .94. I will look into this.

Interesting! On my Falcon the '--------' doesn't even appear at all.
GEM-view id's the file, then there is a (brief) pause, then the
palette and dithering stuff starts happening. This is with GVIEW 3.17.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> Perhaps you will have to send me your Falcon;-).

Shall I send you my JPEGD? Or perhaps you have an auto-folder
based DSP-routine for mod-playback, as I know such things exist.
Maybe something like that is blocking the DSP from being used by
other apps...

Cortex have had a rough detail about it for months now. Istari in Sweden
are designing it. The chip will be a 200Mhz(?) MPC (PPC core, with extra
stuff as well). No release date available tho'...price is 200 pounds?

Few Kiwis are eccentric like John Britten, but many Kiwis have the same
'build it from #8 fencing wire' attitude that he does! I think it is the
eccentricity that gave John Britten his desire to do what he did, as most
Kiwis are not usually as results oriented as him, even though we can fix
anything with #8 wire!

> Well it is unfortuneate that you haven't seen one raced. Unfortuneately it
> never seemed like the Britten was racing, until you saw the other

I've watched on TV only. I used to watch the 500 GP's and only sometime would the Britten bikes get on the telly, because they were only allowed in open class racing?

Does he let you ride his factory Ducati? A friend here has a Duke but I'm too chicken to ride it! The biggest bike I've owned is a 250cc V-twin 4 stroke Honda, which isn't quite as powerful as a big Duke! :)

Http://www.geocities.com/SiliconValley/Bay/8745
The Atari Launchpad. Here among other things you can find a list of all the
FTP sites for the Atari. The UMICH site is not listed because you cannot
access it via FTP anymore.

ftp://193.190.204.128 or chapelie.rma.ac.be (hope thats correct)
is the Belgian FTP site. Great for currently developed Multi Tasking
software support among other things.

http://www.fatal-design.com/
This is where you can download TOS dump prg as well as other TOS ROMS.
There is also two other emulators supported there.

Wants to steal it and doesn't even have the title correct.

I am dying.

Now if you were the author of the program I would be on the floor.

I don't expect the original poster to reply.

I guess, I shouldn't ask you to email me a copy? I have no musical instruments, no talent, and don't even know what the words sample and groove really mean. But if it can make me money, I should receive it via email like all the other emails I get telling how to earn back my investments many times over;-).

Anyways, I am not into music software, which is probably why it is one of the many titles I haven't heard of.

Thanks for your input.

Would be a neat name for a game however.

Nah, I prefer the name X Zero for a game:-).

>>
>>But now this is occurring to me in other NG where the threads become very
>>long.
>>
>> It would appear like a NEWsie Problem.
>
>I hesitate to agree -- but perhaps?

Well the solution is quite simple. I didn't understand when people spoke of
NEWsie truncating the references the problems it could cause. I just
thought it would lose the thread buy post the message creating what would
appear as a separate thread.

However I may be wrong is this assumption as I am in Many.

I simply Carriage return all the references down the next line and as many
lines as I needed. This has returned the thread to me. Well I better check
the evil Terry May thread just to make certain. But so far it has worked.
It has also allowed me to see my own posts once again.

Therefore, when You reply to a thread that is very long, you must do this.
A good sign is when the thread seems very active, suddenly dies and you

can't see your own replies:-).

I will update this as I discover more.

Later Brian.

I am going to keep this short as something to try. I have seen the Magic
Error messages when my Memory board went flakey.

Perhaps your Ram is coming and going. Strange but true.

I have read over quickly your problem, so please forgive me if somewhere in
this long post there is a line stating that you have done this.

I hope this helps.

Here's a rough translation... (employing my poor Grade 12-level French
:)

Yesterday in the news on Radio SWR3 (southwest of the RAF), they said
that the there is a Y2K bug at Bill Gates' residence:

Just as there is a problem with Windows 2000 or Office 2000 (I don't
know which), their (publishing system?) will publish books with the
dates "January 1900".

I couldn't hide a little evil laugh--I was alone in my car. :)

-- end translation -- there y'are. ;-)

Well, it is still there, but no one knows how to access the site. At least
the files that are there are remaining.

>Can you get me that URL please?

Its Above:-). Like I said there is still more there than anywhere else,
like before. But Belgian is very very very current.

>Do you still have the archive maintainers e-mail address?

Yes, it is an automated robot. It works pretty good too. Unfortuneately,
it doesn't know what to do when I wish to speak with people. I have a name
for this robot. HAL:-).

>I used Mint long time ago, and it was at its beginning and not very stable.

Its come along way from those days. It would seem alot of years have passed
by for you. Why interested in Emulation? If it is for Games, the Gemulator
will not be good.

>No I don't. Thanks for helping.

Well, I don't usually help emulator guys at all ever. Because the
conversation is usually something like this. I wanna play games on my PC, I
got this program for my PC and my ST games don't work, or where are more
games, or I have installed it and no one in the emulator group will answer
my emails. Other really whiny stuff.

WHereas there are actually a few guys in this NG that use PCs for
emulation, you usually don't even notice, and they are not crying in the ST
sig that some game doesn't run on their PC.

So you didn't sound like a loser:-). Hows that.

And should you decide that you are using your PC to run ST games, get
Pacifist and try not to post here about why it is not working for most of

the time there is little sympathy from the regular Atari Users, and a random chance that an Emulator Reader might email you some help. The Fuji BBS covers emulation among other things.

Anyways hope you got all the URLS to Little Green Desktop etc.

Later Brian.

Brian Van TIlborg wrote:-
>See, I have clicked the USE DSP in the Global Menu, and it doesn't work for
>me. So I am not smart yet.
>
>But thanks for your help, anything else would be appreciated.

According to the history document (in the v2.85 section) for GEMView
the DSP JPEG loader will only be used in a registered version of
GEMView.

Is yours registered?

Beyond that I am stuck.

I have occassionally come across a situation where the DSP seems to be
locked. Apps that wanted to use it couldn't. Only a reboot would
fix it.

The JPG DSP cookie was mentioned in this, or the earlier, thread. Is
this present? The cookie is called "_JPD".

This may have come up before so apologies again for a stupid question.
Have you tried the Brainstorm JPEG viewing accessory? This would at
least prove whether your JPGD auto folder program was functioning
correctly.

Rich.

>GAL chip??????!!!!!

Yes, the address range for the FPU has to be decoded somehow (32 addresses starting from $FFFA40), memory space has to be determined (CPU signals FC0 and FC1) and also the DATA STROBE signal has to be created (CPU signals -UDS and -LDS). If you have the FPU but not the GAL, as far as I know the latter can be substituted functionally with about four 74HCT** chips- but one would have to look at the MSTE schematics to confirm this and see how to fit a little bard with these chips.

Cu.

On the Atari 800, it had the CPU on it's on board.

> >a removable personality

> Atari pioneered the concept of daughterboards.

I'm not sure who started the concept of daughterboards, but the Atari
800 is built almost entirely with daughterboards. The ROMs are on one,
each 8K or 16K memory board is one, and the CPU is on another.

> >and the modular design of the A800 and A400 memory system,

> Those machines were incredibly expensive at the time,
> and using modular memory would have made no sense in terms
> of cost.

To upgrade the memory on an Atari 800, you open the top cover, and
insert the memory card. All the memory is on either 8K or 16K cards.

And there are some 800XL's which have all the chips socketed, including
the RAM. Makes it easier to do a 256K upgrade!

|cookie jar is.

You will probably be inundated by explanations from people who
really know what they are talking about but it seems to be a place
where certain programs leave a message to say that they are
installed or, in the case of the machine itself, what hardware is
available (CPU, FPU etc).

<madmax@bfree.on.ca> writes
>
>What would you buy?

If you aren't aware of what is available, you can't/wouldn't buy it!!!
Recently I wasn't aware that a do-it-yourself chain of stores also
incorporated Petsworld and a comprehensive craft section as well. My
local 'Do-it-all' d.i.y. store didn't have these available. It was ONLY
a small advert, and it wasn't a commercial one at that, that I saw.

>What informative post from Ben have you seen recently?

Ben is still supporting the Atari format. And what about the newcomer to
the newsgroup scene? Don't they deserve to be enlightened? as thge
majority STILL don't know about usenet...

>Within the last year?

Ben was after a couple of Jag titles I had for sale, he had something I
wanted. He is trustworthy:)

>What users group are you near?

There are many postings in this newsgroup, I can only count a couple
that mentioned anything about user groups.

I myself put out a plea on behalf of someone wanting to compile a list
of user groups in the UK, and I only got 3 replies:(

So I personally don't think it's fair to expect every posting, or every
1 in 100, to state 'what user groups' there are!

>
>And his posts for sales could be limited to once a month. Simply stating
>his WebPage. I have received his listing of Atari Goods in the Past.
>Regardless, Ben only posts here when he wants something, or wants to sell
>something. He states it himself. I don't follow this NG. He doesn't take
>replies to his posts for help in this NG. Only Via Email. That tells me how
>involved he is in this NG. He doesn't even read followups to his own posts.

Limiting posts to once a months, will give the everyday user a feel of
stagnation. It also won't show the other software/hardware that may come
available within a week.

There are the user that only reads newsgroups every now and then, if you
read this newsgroup regularly you will notice it. I have my expiry times
on my newsgroup client set to 8 days for the Atari groups! This means

any article that is 8+ days old will be deleted, this is tough is I've been away for a week or so!

I was also under the impression that the internet 'imformation superhighway' was all about giving and obtaining info... Even this thread is performing a function that you have just complained about!

I must agree with the concept/netiquette if you place an article in a newsgroup then expect the answer via the same, newsgroups are a public forum/place. The only time I think a reply should be sent via email is if it's of a personal nature; an address etc.

How many postings have you followed up that contained a web address? I rarely bother!

Publishing long postings is also frowned upon. I got flames to hell because my signature was more than 5 lines long! these people would have a heart attack at the length of some postings I've come across:)

Not all internet users have access to web browsers. The last time I use Newsie (a news, email, ftp, www... client) it could only do text browsing.

I myself have started to add a link to the precise file for download in a couple of file formats, to overcome this type of problem.

This still doesn't satisfy the casual buying. We all like window shopping, and buy things on the spur of the moment! How many people you know that go into town JUST for one thing, and not for a look around.

To be honest I think it silly complaining about postings that are relevant to the group when so much bandwidth is taken up advertising pornography, of which CHILDREN can gain EASY access. They don't need to enter the sites, there are pictures that make Mayfair & Penthouse look tame on their homepages!

You didn't read my post completely... I saw one, and
decided not to buy it because the Atari logo was a
really bad interpretation, not the original :-(

They don't even make computers now! :)

Wouldn't it be great if Atari was reborn, hasbro got the finger out and
got a console up there with the playstation and dreamcast, hell, they
could even go as far to put Windows CE on it :) They prolly won't, the
company that invented the home console making another! It would prolly
go down like the jag...

Richard. Were we talking about stupid earlier?
Why would I RTFM of the history doc, I am only trying to diagnose a
problem:-).

>Is yours registered?

Actually I had asked if it was still supported when I first came on this
group and the answer was no.

so

um

no mine isn't:-(.

>Beyond that I am stuck.

I now want to thank all the people in this thread who have tried to help me
with my non working DSP FALCON.

I am just dying right now. I wasted alot of peoples time. This is truly
funny. At least I know Gemview was well registered.

No wonder I finally got the DSP working with CAB and Not GEMVIEW.

>I have occassionally come across a situation where the DSP seems to be
>locked. Apps that wanted to use it couldn't. Only a reboot would
>fix it.

Not the problem here. I have been email DSP utilities from everywhere by
many good souls. All proving what a sound Falcon I have. So I check the
other SOLE under my shoe, and found the answer.

>Rich.

Thanks for you help. You have solved one problem. I will look in the
Cookie Jar and see whats there.

>If you aren't aware of what is available, you can't/wouldn't buy it!!!
<SNIP>

Hi Steve. That comment and all others in MY post are directed at Alan
Sharkis only. If you read his post, he doesn't have Atari. Uses a PC and
has never purchased from Ben.

I was just curious what this X Atarian would buy from Ben, since he never
bought from him when he had Atari.

I found it ironic myself.

>
>>What informative post from Ben have you seen recently?
>
>Ben is still supporting the Atari format. And what about the newcomer to
>the newsgroup scene? Don't they deserve to be enlightened? as thge
>majority STILL don't know about usenet...

Alan stated that Bens posts where informative. I want to know, just what
post Alan thought was informative? I want to read one of Bens Informative
Posts.

>>Within the last year?
>
>Ben was after a couple of Jag titles I had for sale, he had something I
>wanted. He is trustworthy:)

Like I said. Bens SPAMs only seem to revolve around when he wants
something, needs help, or wants to sell goods.

I am looking for the informative post that Alan has read.

Tip, Trick what have you.

The last informative post I have is that he
needed a CRACK copy of Sundog.

>What User Group are you near?

Again Alan Sharkis Question.

>>And his SPAMs for sales could be limited to once a month. Simply stating
>>his WebPage. I have received his listing of Atari Goods in the Past.
>>Regardless, Ben only posts here when he wants something, or wants to sell
>>something. He states it himself. I don't follow this NG. He doesn't take

>>involved he is in this NG. He doesn't even read followups to his own posts.

>Limiting posts to once a months, will give the everyday user a feel of
>stagnation. It also won't show the other software/hardware that may come
>available within a week.

No this will give the everyday user a break. Perhaps you too haven't
realized that his SPAMs are offending many people.
Don't think that this is a good action for All Atari Dealers to follow.
If you are new here, I am certain you will find places to purchase Atari
Software.

>There are the user that only reads newsgroups every now and then, if you
>read this newsgroup regularly you will notice it. I have my expiry times
>on my newsgroup client set to 8 days for the Atari groups! This means
>any article that is 8+ days old will be deleted, this is tough is I've
>been away for a week or so!

Perhaps this is why you missed the previous post.

It is about a PC user, former Atari User, who praises Ben and says he is a
good guy, that his posts are informative, and that he himself has never
ever bought anything from Ben.

What would you think?

So I asked a few questions.

>I was also under the impression that the internet 'imformation
>superhighway' was all about giving and obtaining info... Even this
>thread is performing a function that you have just complained about!

No I haven't complained about that. I have praised that. I have complained
about Ben and his SPAM. Completely the opposite of what you say.

>I must agree with the concept/netiquette if you place an article in a
>newsgroup then expect the answer via the same, newsgroups are a public
>forum/place. The only time I think a reply should be sent via email is
>if it's of a personal nature; an address etc.

That is what the thread is about. One person SPAMS. Doesn't Participate,
and Always wants help for himself.

Clearly I am not alone in being offended.

>How many postings have you followed up that contained a web address? I
>rarely bother!

You just open window buffers, click on the URL with NEWsie and get a quick peek of the webpage, takes seconds. If the page has something useful, you can left shift click and load the URL in CAB. If people don't follow up on a URL that is their choice. If they want something, they will.

>Publishing long postings is also frowned upon. I got flames to hell
>because my signature was more than 5 lines long! these people would have
>a heart attack at the length of some postings I've come across:)

Hallvard still around:-). I miss him putting people in line:-).
Regardless I am certain you enjoy the postings mentioned above. I particulary like the HTML SPAM with Binary attachments of a picture of the SKY!!! No I don't like this. I don't like automated postings.
This is a discussion group.

>Not all internet users have access to web browsers. The last time I use
>Newsie (a news, email, ftp, www... client) it could only do text
>browsing.

You are correct. This doesn't prevent you from seeing the WebPage. I use it frequently. I actually don't think enough users use it. It is faster than CAB.

Which brings the second point. Why wouldn't you use CAB if you wanted graphics?

>I myself have started to add a link to the precise file for download in
>a couple of file formats, to overcome this type of problem.

I don't follow you. I have no idea what this has to do with Spam?

>This still doesn't satisfy the casual buying. We all like window
>shopping, and buy things on the spur of the moment! How many people you
>know that go into town JUST for one thing, and not for a look around.

Perhaps you should read my post again. Perhaps you should read the previous ones in the thread. I don't follow you once again.

>To be honest I think it silly complaining about postings that are
>relevant to the group when so much bandwidth is taken up advertising
>pornography, of which CHILDREN can gain EASY access. They don't need to
>enter the sites, there are pictures that make Mayfair & Penthouse look
>tame on their homepages!
Then only part that is relevant to the group is that it is SPAM and should be eradicated. But the truth is, no one would be complaining if Ben participated somewhat himself. He doesn't, its his choice, and thats fine.

That argument above is very weak.

Finally, I think it was when I was a NEWBIE here, after a month or so, I got Bens Catalogue sent to me Email. All I saw was alot of used, old software, much of which I already had. I probably have a collection of original software and duplicates just as large. But I don't recall seeing anything CURRENT. If I am incorrect then perhaps I need another visit. But in 24 months all the Spams haven't convinced me for a second look. Infact

just the opposite.

Later Brian.

>
>Now this is what I want in CAB.

Perhaps I'm stating the obvious here, but:

Make sure you've got JPEGD.PRG in your AUTO folder, and that the DSP
version of CAB_JPEG.OVL (that comes in the archive with JPEGD.PRG)
replaces the standard CAB_JPEG.OVL file in the MODULES folder.

I simply rename the original to CAB_JPEG.OV_ in case I want to switch back
to it if I find a site that uses a lot of progressive JPEGS (Like the
Atari Historical Society).

But in my particular testing, I found the DSP-based CAB_JPEG.OVL to load
in a matter of a few seconds a picture that took the regular loader nearly
a minute to display.

And for the record, on my Nemesis-enhanced Falcon, CAB displays all
pictures the fastest in True Color mode - simply due to the fact that
there is no dithering etc. And this is also true whe utilizing the DSP
loader with ImageCopy and Positive Image 2.

>So, I still need to know what is up with the GEMVIEW and CAB? I will check
>out my JPEGD for its date, as well as unzip this JPG overlay from the STik
>Pages.

I personally have always found GEMview to be one of the slowest at
displaying pictures out of all image viewing software on the Atari [that
I've tried].

I didn't buy one because of a real fear of being mistaken for one of the hordes of 1970's retro fashion victims!!! ;-) Most of the people who will end up using these bags wouldn't recognise a ST/TT/Falcon if it punched them on the nose!!! ;-)

I remember the 70's, and they weren't great - goth music and TOS computers as we know them didn't exist... ;-)

Missed the beginning of this but I certainly _sometimes_ get HD
access on the Hades when CAB is 'Resolving Host'.

You need an interface such as Link from ICD (but from previous
postings, ICD is defunct?).

There is a simple CPX that will let you peek in the cookie jar
so you can see what all is installed. Granted you may not know
what the items mean, but you will see new ones appear depending
on your bootup. If you send me an e-mail I will gladly forwawrd
you this CPX. The DPS loader installs "_DSP" I think, not 100% sure.

I currently have one for sale on the Ebay web auction.
Go to http://www.ebay.com and search under ATari ST

I have the following Atari items currently in the auction
Atari 1040ST Computer
ICD Tape Backup Drive & 270 Meg SCSI HD in ICD Case
ICD Advange Plus SCSI Host Adaptor Card
Syquest 230 meg External SCSI Drive w/cartridge. (other Syquest items
also avail, email for details).

Atari Jaguar
Atari Jaguar CD Player
Various Atari Jaguar games with more still to sell I haven't yet
listed.. Email if your looking for something.

As I have stated before, I agree wholeheartedly. You know, the number of people who have chosen to devote a portion of their lives to accumulating and offering for sale the Atari computers and merchandise which we collectors seek, is constantly growing smaller and smaller. The commercial Atari vendors fall by the wayside almost weekly, and it is almost unbelievable that a segment of our community tries to give those few dedicated souls remaining a "hard time" about posting advertisements of their offerings. Ease up! ...and take time to *appreciate* and patronize the people who keep our Atari heritage alive through their small businesses and online offerings!

4886. BIG problem : Falcon + freeMiNT + N.AES

Newsgroup: comp.sys.atari.st
Date: 1999-12-31 00:00:00 UTC
From: Karl Samyn <saka@village.uunet.be>
Message-ID: <386BF977.6CF76BD@village.uunet.be>
Source record: 68035

Hello ppl,

Recently (on monday 27 dec 1999) I encountered some strange problems on my F030 with MiNT (v 1.15.1) and N.AES (v 1.2). A completely working setup didn't work anymore... and no changes were made (except some changes to the icon.rsc file of Thing) to the setup compared to the day before.
It went from bad to worse : first only poblems with Thing, a few boots later with N.AES and then even with MiNT ! Reinstallation of the MiNT Kernel and N.AES didn't work : the path to n_aes030.sys couldn't be found, although it was written in the mint.cnf file and was at the location written down there.

Even the specialist Martin "Nightowl" Byttebier came over to me tonight to try to resolve the problem I had with MiNT and N.AES.
After Playing around an entire evening with my F030, copying NAES and MiNT from partition K to C to I(=Minix) I gave up hope... always a bus error when NAES had to be loaded. MiNT alone was loaded OK, we checked.
A constatation both of us made was that even in single TOS the machine has troubles. But no troubles were detected when the F030 booted in MagiC.
We concluded that there might be a hardware problem, but where?

I turned of power and opened my machine, found nothing special inside and closed it again. I started again my machine in single TOS and had no troubles this time. I rebooted in MiNT and NAES and this time I succeeded to load NAES (saw the logo and also the acc's and taskbar were loaded, but thing was'nt loaded. I got this :
exit code : 2560
A few rebootes always gave me these lines :
pid 0 (MiNT): assert (`proc->wait_q == que`) failed at line 466 of proc.c

A couple of boots and hours later, it even gets tricky to boot my computer (no changes were made to software since my semi-succesfull MiNT boot described above.
When I boot with Single TOS (only auto prg's fpatch2 metados and xboot activated, no acc's and cpx's), MagiC (FATAL ERROR IN GEMDOS msg during boot), MiNT, my computer puts me randomly a number of bombs (sometimes 0, mostly 2 or 4) on the screen when booting. This just after HDDriver gives me the harddrives and partitions connected to the system. My normal boot sequence continous after the bombs, with without Xboot and when I boot in MiNT the message from above :
pid 0 (MiNT): assert (`proc->wait_q == que`) failed at line 466 of proc.c

finnaly appears again on the screen.

Another strange thing : when I shut-off my computer completely for a couple of minutes and power it on again then, everything works fine, I even succeeded to load Mint, NAES and Thing right now (without changing something). But when I try to open everest, again the message from above appears.

Now my questions, I do not know the boot sequence of my F030, so could it be possible this is a hardware error somewhere? Any idea where? Maybe a bad read-out from the ROM? Bad read-out from the IDE harddisk inside my computer?

Does anybody has an idea... all ideas all welcome... my system can't be f***ed up more then it is now ;-)

BTW does anybody know anyone who can repair my F030 in case it is broken... in the neighborhood of Belgium (City Kortrijk-Courtrai). Neighborhood is anything less then 500 km.

>
>It's all part of my conspiracy to squelch everyone's opinion but my own.
>;^)
>
>Seriously, that is strange. I have no idea what the problem is.

Well, I do thanks to Lonny. Your Conspiracy has failed:-).

Apparently NEWsie Truncates the references. THis is because we all use
different editors and such in NEWsie. SO I just had to manually carriage
return the references and I was able to see my own posts once again. That
is what the test message was for.

Now what I still don't understand is why I could get your replies in the
thread but absolutely no one elses. It was surprising to see you replying,
again and again to people with their quotes and me not even seeing the
post. I will know if this continues as soon as you offend someone else in
this thread. You must do it here. In this thread. There must be somereading
this that doesn't like you that can post something that you disagree with
and then you can reply to it. Hopefully I should then get both the original
post and your followup.

So don't waste anytime.

Here let me help.

I would prefer one Mint Developers input vs One PC users input.

Not very productive to say the least. But this is for the good of the
whole. It is important, that I solve this:-).

Please, valued readers, say something naSTy to Terry so that he can reply.

It shouldn't be hard, just say what comes naturally.

Seriously, I need a few posts in this thread.

Later Brian.

This is how it would appear. At first I received your messages fine.
Then I get some messages from you a week later in HTML. Then I get every
post from you duplicated. 1ST in PINE, 2ND in HTML.

The HTML is sent courtesy of the MICROSOFT INTERNET EXCHANGE.

Anyways, your posts today don't have the accompanying HTML, however that
doesn't mean I won't receive a duplicate in a week courtesy of MS:-).

So it wasn't just me and there were roughly 5 posts that I came across like
this. The funniest being your request for an ST.

You did not see the Repost this WEEK? It is a courtesy of MS trying to help
you find a real computer. That is why they reposted in HTML a week later.

This isn't fair. I want everyone to get these and be annoyed.

Anyways, I will discuss this with my provider if it continues.

It could have been just a short term glitch.

What would you buy?
What informative post from Ben have you seen recently?
Within the last year?
What users group are you near?

And his posts for sales could be limited to once a month. Simply stating
his WebPage. I have received his listing of Atari Goods in the Past.
Regardless, Ben only posts here when he wants something, or wants to sell
something. He states it himself. I don't follow this NG. He doesn't take
replies to his posts for help in this NG. Only Via Email. That tells me how
involved he is in this NG. He doesn't even read followups to his own posts.

Regardless, He does post for user group meetings which is beneficial. Again
I believe this is automated.

Ben is too late, The Tramiels are long gone. Go to ATARI.COM
and cry. Because Hasbro has rejuvenated Atari. Unfortuneately it is the
Atari that most Americans remember. There are a few nails here as well.

Seems Ben has been shortchanged. It is not the first or last time something of this nature will have occurred. I only just found out about the HADES purchase through Computer Direct, where a NEW ZEALANDER lost $2500. This puts nails in the Atari Community. Atari is DEAD! IT is the community that survives. If this NG was gone, So would my Ataris. If I had known soon enough I would have trekked out west and made certain that the individual in question paid dearly for his indescretion. No point in asking for money when it is easy to break bones. Infact should I trek out west in the future this possibility always exists. I just hate such stories that ruin my hobby.

>> Ben is a nice guy that I have gotten parts from on occasion and never

How does this appear compared to a Falcon, CAB/STing combination?
I am not certain I follow you. What happens when you don't have STing loaded and want to load in a page? Does this still happen? How many Hosts and URLs are in your Cache?

Have you cleared your Cache and tried it? Or eliminated all the useless ones and freed things up. I have little delay with regard to your problem with my ST/TT/FALCON, and only Resolving itself can be a problem with STing when I type in a useless URL. Mind you I haven't updated STing since version 1.08 and am going to install the latest version on my MegaST next.

Not unless we are allowed FTP access to the Atari UMICH Site:-). I just noticed in your email the umich.edu address. I hope that this site is never deleted. There are many files there that I use frequently.
Anyways the HTTP access allows us to download files but no longer upload files. I figure you must have knowledge of the files there since you wish to do Atari Emulation.

Correct.

Yes. I am going through my list of the UMICH archives but I don't believe the TOS roms Dump program is there. Its a big list and not all files are in the index:-).

I have it an can upload it there, hint, hint.
TOS images and TOSDUMP can be found on the internet at the Little Green Desktop Webpage. However I would like to know if you have anyinformation with regard to the UMICH FTP site. FTP access disapeared around January of this year when some changes where being made. However, the http access is still available and I do not one someone to say, "OH is that old Atari stuff on our servers, delete it an make room for ....."

The TOS DUMP program is what you need if you have an ST to dump the roms to disk from. If you don't have an ST, the Roms can be had at LGD. No need to write you own unless you are looking for something to do.

>If you were looking for an archive, which ftp site would you look at these

The most current is the Belgian FTP site. The UMICH site is still by far
the largest. It is perfect if you have an older ST and an older OS such as
TOS 1.0, 1.2, 1.4, and 2.6.

But not as useful for more current Falcon, TT, Milan, Hades support.

There is still Mint files there.

Magic, and More recent mint Files are at the Belgian FTP site.

>Help is greatly appreciated.

Hope this helps, I will follow up with the Url for the Belgian site.
I assume you already have the Umich one:-).

And how are you going to get this Milan II?

We will all be interested, here in NA.

Later Brian.
